

Plumbing Supply and More Expands Access to Exact-Match Boiler Parts for Hydronic Heating Repairs

November 23, 2026

Caln Township, Pennsylvania - November 23, 2026 -

A hydronic heating system is only as dependable as its weakest component, and a single degraded part can determine whether a building stays warm through the cold season. A primary control that cannot complete a clean ignition sequence, a Flo-Chek valve that no longer seals against gravity flow, or a steam air valve with a blocked element can each reduce comfort, raise fuel consumption or trigger a costly no-heat call. For contractors, technicians and facility managers working to keep these systems running, sourcing exact-match boiler parts remains a central challenge, particularly across equipment that ranges from cast iron steam boilers in older buildings to high-efficiency condensing gas boilers in new construction.

Plumbing Supply and More has positioned its Boiler Parts and Accessories category as a resource for that work. The section carries more than 170 products from manufacturers including Taco, Weil-McLain, Watts, Hoffman, R.W. Beckett, Field Controls, LAARS and Honeywell. Buyers can filter listings by brand, item type, length, manufacturer and suitable-for-use-with designations, a structure intended to help match a component to a specific boiler model rather than to a general category.

The Plumbing Supply and More Boiler Parts selection spans several functional groups. Gravity-operated Flo-Chek valves, offered in several pipe sizes, prevent unwanted heat migration into inactive zones, while automatic air vents and steam radiator air valves remove the air that causes corrosion and heat-transfer problems. Boiler manifold kits and pre-assembled header modules from Watts, Weil-McLain and LAARS are designed to reduce field labor and potential leak points. The category also includes oil burner controls, igniters and electrode kits from R.W. Beckett, along with primary controls that replace older relay-based units.

For combustion and airflow, the listings cover burner motors, inducer fan assemblies and power venters. Modulating condensing gas boilers are supported with blower kits and electronic control modules, and routine service is addressed through annual maintenance kits, hot surface igniters and pilot assemblies. Additional items include gas controls, combination boiler feed valve and backflow preventer assemblies, tankless heater coils, magnesium anode kits and zone valve actuator heads.

Industry practice guides much of how these parts are selected. Replacement components should match the boiler model, and condensing boilers in particular rely on burner controls calibrated to their specific blower and heat exchanger. Factory maintenance kits help keep materials compatible and support manufacturer service requirements.

"Boiler service rarely allows for guesswork, because the wrong part can mean a second truck roll and a cold building in the meantime," said a spokesperson for Plumbing Supply and More. "Organizing the catalog around brand, model and compatibility reflects how technicians actually diagnose a system in the field."

The spokesperson added that demand continues across both legacy and modern equipment. "A technician might service a decades-old steam system in the morning and a condensing gas boiler that afternoon, and both jobs depend on accurate matching."

Plumbing Supply and More is a family-owned supply house with 75 years in operation, offering wholesale pricing to trade professionals and homeowners and a 30-day return policy. Boiler Parts on Plumbing Supply and More can be browsed at plumbingsupplyandmore.com/hydronics/boilers/boiler-parts-accessories.html.
