

Campbellfield Firm Offers Evaporative Cooling Buyers Guide

November 28, 2016

November 28, 2016 - PRESSADVANTAGE -

Snowman Heating & Cooling offers solutions for home and business cooling needs. An evaporative system provides fresher and cleaner air throughout the cooling process.

Campbellfield VIC: Snowman Heating & Cooling and owner Rami Snowman are pleased to announce the release of their "evaporative cooling buyers" guide. The Snowman evaporative cooling professionals have the knowledge and experience to offer suggestions and a comprehensive price quote to upgrade or replace existing cooling systems with the efficient and clean evaporative cooler systems. Evaporative solutions are clean and comfortable for Melbourne properties. They eliminate harmful allergens and particles.

The Melbourne evaporative cooler installation process places a ducted cooling unit on the roof of the structure and connects to various points placed throughout the residence of business. The system filters air through pads to remove elements that can affect overall health. This solution is particularly important for those individuals who suffer from asthma. The air in the home is turned over repeatedly, since warm air is

pushed out of the structure through the ventilation systems as the cooled air is pumped throughout the house.

According to owner Rami Snowman, "For areas where stagnant air can remain under traditional systems, an evaporative system can be effective at eliminating unwanted odours. The system delivers 100 percent fresh air at all times, so the doors and windows can remain open. This allows for lower energy costs. The purchase price and installation costs can be much lower than traditional cooling systems."

The Melbourne-based technicians ensure that all of the many benefits are available to home and business owners who choose evaporative systems. The air is healthy and clean using an energy efficient solution. The system is much quieter than traditional cooling systems and it is easy to operate. The entire building can be cooled in a matter of minutes. The quality products and manufacturing process mean that the unit will be durable and long-lasting. The units were designed for Melbourne and the surrounding areas to provide the right solution for seasonal cooling.
