

Launch of WikiTrader Software Announced

December 21, 2016

December 21, 2016 - PRESSADVANTAGE -

Square ENix Music offers a comprehensive explanation of the features and benefits of the Kelly Wallace WikiTrader Software product. The software is a new binary options trading system software product that makes trading binary options easier.

WikiTrader Software by developer Kelly Wallace is a new software product, designed to improve the performance of traders in the binary options trading industry. The Kelly Wallace WikiTrader Software is an improvement over the current binary option trading space and automated software system. The challenge before the launch of the trading software has been finding software products which are reliable and successful. WikiTrader has been used by elite traders and brokers for a number of years, and is just now being released for beta testing use.

WikiTrader software is an artificially intelligent platform which learns from the behavior of its users and the changes which are happening from day to day and minute to minute in the market. The learning occurs through studying trading patterns. Although the software has been in operation for many years, the alterations in the beta testing need to be fine-tuned.

According to tech venture capitalist Kelly Wallace, "My team and I have invested millions of dollars in space travel companies, Hyper look and various other firms on the cutting edge of technology. These days, the rich get richer and the poor get poorer and I don't like that. We have developed the binary trading app to change that paradigm. The release of the software system to a select group of beta testers is an attempt to create a platform where you can make money in binary trading without any training or experience in financial trading."

The trading platform was conceived by accident. Kelly and one of the developers on her team created an open source trading software for personal use. They wanted to avoid paying broker costs and fees. Further, they wanted to create an intelligent software system which learned from the trades made by the users. The artificial intelligence of the software meant it could predict the market's future and which trades are most likely to win.
