

Engrave Ink Launches Commemorative Ink Product for Tattoos

December 28, 2016

December 28, 2016 - PRESSADVANTAGE -

Engrave Ink offers an original bottle of commemorative tattoo ink created from the ashes of a loved person or pet. The tattoo ink is a way to celebrate a unique and wonderful life.

Nevada USA: Engrave Ink is pleased to announce that their innovative laboratory in Nevada offers a full-cycle sanitation and mixing process in a secure and environmentally friendly location, with personal attention at each and every step. The laboratory will ship a kit to retain a portion of ashes of the loved one and ship them back to the laboratory. The kit includes easy-to-follow directions, a serialized tamper-evident container and return postage for orders coming from the United States.

Engrave Ink tattoo ink is prepared from the ashes received at the facility. The unique filtering process which is followed reduces the ashes to a microscopic particle size. The particles are heated to more than five thousand degrees Fahrenheit under a medically sterile environment. The extracted carbon is mechanically agitated to mix with commemorative ink to a uniform consistency. The entire process requires about four

weeks. Throughout the process, the product is tracked using a unique number.

A spokesperson for the company explained, "Our knowledgeable staff takes pride in creating, presenting and delivering a commemorative keepsake of everlasting love. With the closeness offered only by Engrave Ink®, you will have your loved one with you and in your life at all times. The same careful attention is given to products and services for pet owners.

The utmost care and attention is ensured in the production and shipping of commemorative ink. The quality control measures are applied to take care of the standards of the final ink product. Separate manufacturers are used for white inks, as opposed to black inks. Sterilization is assured to avoid harmful and hazardous metal particles which can occur when the temperatures are less than cremation levels of 1400 to 1800 F. The attention to safety and quality results in a high quality commemorative tattoo to recognize the life of a pet or loved ones.
