Smile Cliniq Describes its Smile Design Procedures

January 18, 2017

January 18, 2017 -
Smile Cliniq offers a description of the elements which are required to create a new smile for the patients. The components of the plan include initial consultation, assessment and planning.

London UK: Smile Cliniq is pleased to announce that it has been awarded the best dental practice London prize. The team of professionals at the dental practice offer top quality smile design, regardless of the level of help needed. The efforts begin with an initial consultation by one of the dentists. The patient will be assessed and a plan created. The information will be thoroughly discussed with the patient before the work proceeds.

Smile Cliniq professionals begin with the acquisition of pre-operative pictures and assessment of tooth shades. The ceramist obtains impressions from the dentist to create a diagnostic wax up so that patients can view the intended outcome. Digital imaging can be used to allow for a view of the desired outcome. The professionals provide a list of treatment options, projected time frame and costs of the process. Several different factors and measurements are utilized in creating a beautiful smile.

Some of the measurements and factors which are considered include the horizontal and vertical lines, and the smile line, or alignment of the biting edges of the top teeth. The gum line is another factor which is considered. The proportion of the tooth surface which is visible from the front and the proportion of the tooth's length to width is also considered. Finally, the embrasure space is identified.

Additional procedures which are part of an attractive smile design include porcelain veneers to cover stains, chips and other defects in the natural teeth. The veneers can be designed to look like the natural teeth, but without the defects. White fillings are less obvious than amalgam fillings. The white fillings look natural as well as being durable. Porcelain white crowns are also designed to appear as natural as the rest of the teeth. Materials such as emax and zirconia are recommended. Procedures to whiten the teeth are also employed.
