

ToNic Innovations Releases Limited Availability RFID Blocking Sleeve For Credit Cards Through Amazon

June 18, 2015

June 18, 2015 -
Todd Bennett, spokesperson for the company ToNic Innovations, has announced that customers can now buy the Limited Release RFID Blocking Sleeve Credit Card Protectors For Wallet directly from Amazon. Each product comes in a set of 10, and customers will also receive a free e-book called, "Best Tips to Protect Yourself from Identity Theft", with their purchase.

With electronic pickpocketing on the rise, people are now searching for a way to protect themselves from having their credit card, and other personal, information stolen. While in the past there was nothing one could do about this, Todd Bennett stated that the RFID Blocking Sleeve Credit Card Protectors For Wallet By ID Shield solve this problem.

The RFID blocking sleeve has been designed to prevent identity thieves from getting hold of any information that is stored on a customer's credit cards. The way in which it achieves this is by blocking identity thieves that use RFID readers to skim credit cards once they get close to a customer. One example where this can occur is if an identity thief walks up to a person and asks them for the time, which seems completely innocent to the other person. However, during this brief chat, the identity theft is able to retrieve the other persons

credit card information by using a special RFID reader, without the other person realizing what is going on. With the credit card sleeves By ID Shield, these RFID readers are completely blocked, and so the identity thieves walk away with nothing. One customer wrote the following review on Amazon,

"I had several experiences where my credit card was used somewhere random by someone else when my card had never left my wallet. I don't know with what route they got my information and used it. My credit card companies took good care of them but it was still extra work and unpleasant experience. I know I cannot prevent every bad intention but I'll gladly add any extra protection available like home security system. It's more like insurance. I only have a couple of microchip embedded credit cards and they don't get used very often so for me keeping them in a protected sleeve is pretty nice. They seem pretty sturdy even though they are made from paper. It's nicely coated and good thickness."

Todd Bennett stated that the credit card protection sleeves are designed to fit snugly, and can be used to protect credit cards, passport cards, licenses, loyalty cards and any other type of card sized information or identification. He added that they are small enough to fit into standard size wallets and coin purses. Another customer wrote the following review,

"RFID envelopes are the easiest form of identity security there is. With all the hassle that identity theft cause, it only makes sense to take measures to protect yourself. These credit card protectors are very study paper sleeves that don't add extra bulk to your wallet."
