Futurepace Tech Releases Its Insulated Water Bottle Range In UK and Europe

June 20, 2015

June 20, 2015 -
Futurepace Tech LLC, a proud maker of the insulated water bottle, is proud to announce the release of its products into the United Kingdom and Europe. These water bottles are BPA free and do not contain any plastic lining. They are made of durable food grade stainless steel inside and out to assure no metallic aftertaste. They are easy to carry, spill and leak proof and do not sweat. They can also maintain the desired temperature of any water, hot or cold with its double wall insulation. They are a perfect partner for any outdoor activity and are eco-friendly certified.

Robyn Everingham, Co-Founder of Futurepace had the following to say:

"Proper hydration is very vital for everyone. It not only aids in proper digestion and keeping the skin supple, but it also supports the whole body to achieve optimum health. However, the daily recommended intake of water, which is at least 8 glasses a day, is just really hard for some to do, especially if it's not readily available. The good news is, bottled water has reached new heights of excellence with the release of this safe, easy to carry stainless steel insulated bottle."

What people are saying about this water bottle is a strong indication of its excellent quality. It is successful in the U.S. and has received rave reviews. One of its satisfied users has this to say:

"Anyone who shops for a good, leak-proof water bottle knows the choices are vast. The decision to purchase the Futurepace Tech bottle was not a trivial one, nor did I make it lightly. I systematically scoured scores of listings on Amazon before choosing this insulated bottle.

"Several specifications were critical to me: small enough to tuck in my computer bag, leak-proof so I would not threaten everything else in the bag, stainless steel without any liner, a bottle mouth that was meant for drinking directly from the bottle, and it had to keep my coffee warm from one coast to the next when I suffered under the discomforts that air-carriers and modern air-travel provide."

"I have not yet tested this bottle in the air. This morning, though, I filled it with coffee. That was nearly 11 hours ago. I opened the bottle and enjoyed the pleasant aroma of my very-strong brew and the temperature was more than I could have expected. Frankly, it was still very hot. I am surprised and very pleased. I noticed when first filled that the bottle felt warm around the neck where the insulation diminishes. I thought that might lead to more rapid cooling, but seemingly I was wrong. I left my bottle on my desk, on its side as a check for leaks, and with no other means of insulation. There were no leaks and it did what it was supposed to do."

The screw-on cap is snug and feels well-made. Some folks complain of it being plastic, but I am impressed that it is made with a very high-quality plastic with a good seal. The shape of the cap is easy enough to tighten and loosen, even for old hands. The finish on the bottle makes it feel very good in the hands, and even when it was filled with fresh, piping-hot coffee, there was no apparent heat loss through the sides. This bottle will be very easy to hold and carry, regardless of the temperature of its contents.

The bottle mouth is rounded and highly-polished and feels good drinking right out of the bottle. Care should be taken, however. If you are drinking a hot beverage the temperature may surprise you since the bottle and the bottle mouth may not be hot, even though the beverage is.

Another happy user quoted: "This bottle is really wonderful. I have left it in my hot car all day and when I drink water from it, the water is still cold and delicious. There is absolutely no metal taste coming from the bottle, so I feel I am drinking pure water. Even after 2 or 3 days in the heat, the water is cool. This bottle is a perfect solution to the problem of having plastic bottles (which leach all kinds of chemicals if they are scrunched or heated) and glass, which can break. I have ordered one for each of my 2 daughters and one for my husband because I think it is so good. I haven't tried putting anything hot in it yet, but apparently, that will work well too. I wholeheartedly recommend this bottle." For further information, you are encouraged to click here.
