

ProTorch Reveals Their Micro Butane Torch Launch Schedule

July 01, 2015

July 01, 2015 - PRESSADVANTAGE -

The Sydney based company; ProTorch has announced that they will be selling their premium Micro Butane Torch on Amazon. Prospective customers will be able to purchase the torch in the second half of July. The torch will set itself apart from the competition by promoting innovation in design and function as well as unmatched durability. ProTorch will aim at the international market from their location in Australia.

Prospective buyers of the torch have been in contact with ProTorch ever since they announced their product on their Facebook page: <https://www.facebook.com/ProTorch1>. Apart from providing a point of contact with their customers on their Facebook page, ProTorch regularly provides information and tips related to jewelry making and soldering. The manufacturers have kept construction quality as the corner stone while designing this torch. Most butane torches develop faults and defects with the passage of time. Even expensive brands require repairs and replacements for their parts after extensive usage. The most common issue consumers report is that the nozzle of their butane torches malfunction and produce inconsistent flame and debris. This is because most micro butane torches utilize metals in constructing the nozzles. Since the flame of a butane torch can reach temperatures of around 1300 degrees centigrade, they become malleable and deform or even degenerate over time.

Comparatively, the materials used in ProTorch's product have obviously been through a significant amount of reasoning before selecting the components. For example, the nozzle is made of ceramic, enabling for a higher heat tolerance than metal nozzles. This allows the flame to remain consistent and precise throughout its lifetime. The ergonomic rubber handle provides a comfortable grip, while the broad flat base lets the user place the torch in an upright position on the work surface. ProTorch's Micro Butane Torch is primarily made of metal alloys, providing a sturdy feel to it, as well as adding to its durability. The large fuel repository makes for a welcome addition to the length of time the torch can be used. With a constant burn time of about 40 minutes, it outstrips most of the competing products on the market. The flame intensity can also be adjusted easily with the valve, depending upon need.

The refilling mechanism of the torch, like all the mechanisms built into it, is kept as simple as possible. The reason being that there are fewer possibilities for something to malfunction, and if in the event that it does so, can be repaired easily. Building on the promise of quality, ProTorch has promised to follow up on the needs of their customers by providing convenient ways to stay in contact. In order for anyone interested in buying the Micro Butane Torch, or anyone looking for tips relating to jewelry making, ProTorch provides updated information on their website: <http://www.pro-torch.com/>.
