Twin Cities PC Repair Announces Virus and Malware Removal

April 26, 2019

April 26, 2019 - PRESSADVANTAGE -

Twin Cities PC Repair in Egan, Minnesota is now offering a number of laptop repair and other services, including the removal of malware and viruses from laptops and desktops.

Patrick Jensen, a spokesperson for the company says, ?There are many things that can cause a computer to crash or otherwise not work properly. Viruses and malware are the leading cause of slow running computers, and it takes someone experienced in their removal to get the computer back to where it should be.?

Jensen states that the company has years of experience in working on and repairing computers from all major manufacturers. He adds that if someone notices that their computer has begun to run slowly or that there are popup ads being displayed that a virus or malware could be the culprit. He recommends that computer owners call the company to learn more about the issue and the solutions that they offer for removing these viruses. He states that not everyone has the knowledge and experience needed to properly restore computers to their previous state.

?Virus and malware removal is not something that the average consumer can do,? Jensen adds. ?There are

many tutorials and videos online that claim to teach people how to handle these issues but more often than not, they end up bringing their computers to a professional even after they have attempted to restore them.?

Jensen states that consumers can save themselves a lot of frustration and potentially more damage to their computers by simply bringing those computers to the company in the first place. The company uses inhouse utilities to remove infestations and get computers running smoothly once again. Jensen states that with these utilities they can remove malware without the need of performing fresh installations of Windows, which will save the consumer from having to reinstall their chosen applications.

He adds that once the computer has been restored to its pre-malware state, the company offers Managed Anti-Malware software that will help to protect computers from any future infections. Jensen states that malware can be picked up from any number of banner ads, infected websites or certain applications and that consumers who are not aware of these issues may very well end up with an infected computer.

He warns that there are a number of fake programs that claim to remove malware from computers where no malware is actually present. Jensen states that consumers who are not familiar with these fake applications will end up downloading the program only to be infected with actual malware, which is the intent of the application. Many antivirus programs that offer free protection are often fake and will end up infecting computers, causing the need for computer repair. Jensen warns that consumers need to be aware of these issues and avoid any free programs that look too good to be true.

Malware programs are typically designed to be difficult to remove as the malware will embed itself into the program. The average user may not even know where to begin to find the program in order to remove it. Jensen states that the company has many years of working with a number of malicious malware programs for their removal and can remove the program without destroying data on the computer. Many tutorials and videos that are offered online for consumers to do their own malware removal often do not work and if they do work, they typically wipe out the computer?s data.

Twin Cities PC Repair offers a number of services including the removal of any spyware, malware, rootkits and viruses, as well as repairing operating system issues. The company can test for functionality and perform critical system updates for individuals and businesses. Other services include tips and advice from professionals for preventing future infections of spyware and other programs. Jensen adds that if the technician is not able to fix the issue, they can reinstall a new operating system that is free from such viruses.
