

Image Dental In Stockton Adds 3D Printing Technology

May 28, 2019

May 28, 2019 - PRESSADVANTAGE -

Stockton, California - Image Dental in Stockton, CA, is pleased to announce the addition of a new 3D printer in their dental office. The latest addition offers better results and assistance for guided surgeries and cosmetic dental procedures. Along with CEREC technology, 3D printing is another advancement Image Dental has added to their office to give patients outstanding care and amazing results for several types of procedures.

As the premier Stockton dentist, Stephen Nozaki is committed to providing his patients with the latest advancements in the field. Whether it is incorporating new techniques, or adding state of the art technology like 3D printing capabilities, Image Dental is the dental office of choice in the area for cosmetic and general procedures. Staying at the forefront of dental technologies has always been an essential part of the practice, at Image Dental.

The 3D printer is beneficial to all patients that require maxillofacial and oral surgery. Currently, 3D printing technology can be used for receding bones and creating dental prosthetics like crowns and dentures. The technology allows the dentist to visualize the area better and produce results that are more unique for the specific patient. Creating the actual prosthesis provides for a better fit that works for a patient's individual situation.

One of the best additions to the office is being able to deliver high-quality dental implant. Dental implants are used to restore a patient's smile due to missing teeth. One, multiple or all teeth can be replaced with the implants and restoration. The 3D printer creates improved fit and the comfort of the surgically placed implant. The main advantage to having the capabilities of 3D printing include determining the depth and width of the bone, sizing the implants, and determining the best location.

Crowns can also be created with the use of 3D printing, replacing plaster dental molds. Special scanning tools and software are used to create an image of the tooth that needs to be crowned if the tooth hasn't been broken below the gum line. The picture taken is then transported to the printer for creation.

Dr. Stephen Nozaki said, "We provide conservative oral care, such as root canal therapy and fillings, as well as advanced care, such as periodontic services, complete mouth makeovers, and restorations, and oral surgery. Our dentists are focused on you and your smile, which is why we also provide our patients with cosmetic dentistry services and the most up-to-date tech. We also provide state-of-the-art technology, such as CEREC®, a CAD/CAM device that can fit you with crowns in one appointment!"

3D technology is an excellent addition to the dental office. Image Dental will be able to continue to provide the highest level of care to patients and outstanding results for oral surgeries and prosthetics.
