

Albuquerque Solar Installation Now Featuring New Financing Options

July 17, 2015

July 17, 2015 - PRESSADVANTAGE -

Industry expert Andy Morris has identified 7 leading solar contractors serving the Albuquerque, New Mexico area. In order to make residential solar more affordable, some of these companies now offer unique opportunities to purchase a residential solar PV system. This includes announcing new, low-cost financing for well-qualified candidates.

Mr. Morris says, "There's never been a better time to start lowering high energy costs by financing a solar energy installation, while taking advantage of the 30% Federal and 10% State tax credits. New Mexico Energy Minerals and Natural Resources Department (EMNRD) has decided to make residential solar power generation a priority.?"

Reviews of Albuquerque solar companies range between 3.5 and 5 stars. Some things to watch out for are how responsive the company is during the pre-sales process, system reliability ratings, and whether customers have been satisfied with their energy savings.

The biggest advantage of financing a residential solar energy system in Albuquerque is the ability to spread the investment out over time, rather than having to come up with the full cash sum at installation. This is often the deciding factor in system affordability for homeowners.

Estimating the full cost savings of a financed solar PV system requires working with a solar contractor prior to installation. Solar energy is a modular technology, meaning homeowners can install as many or as few panels as they like, based on budget and energy-savings goals. Each new kilowatt of installed solar capacity brings bigger electricity bill savings. With a large enough installation, it's possible to eliminate energy bills completely.

Mr. Morris goes on to say, "Thanks to financing solar energy, countless New Mexicans have eliminated their monthly local utility bill. However large an installation, most homeowners can expect electricity bill savings to grow with time, and pay increasingly large dividends with each passing year as utility rates continue to

increase.?
