

Upgraded 2019 Model For iProven DMT 316 BLU Forehead And Ear Thermometer For Kids Now Available

July 30, 2019

July 30, 2019 -

iProven, a business based in Rotterdam, The Netherlands, has announced that the upgraded 2019 model of their DMT 316 BLU ear and forehead digital thermometer for babies and kids is now available. They want to point out that parents need it for the upcoming flu season. The iProven team members who developed the thermometer are also parents themselves and are very much aware that mothers and fathers are often very worried about their babies or kids who have a fever because of the flu.

This digital thermometer that has been specifically designed for babies and kids is simple and easy to use. This is important because parents are naturally worried when their baby or young child has a fever and the last thing they would like to worry about is how to use a digital thermometer properly. Furthermore, they would not like to worry also whether the temperature reading provided is accurate or not.

"The DMT-316 BLU digital thermometer can prove to be very helpful during the flu season. Fevers can be tricky, particularly for babies up to 3 months. When the newborn baby's temperature surpasses 100.3 degrees Fahrenheit, it is advisable to call the doctor immediately," says Suzanne, spokesperson for iProven.

She continues, "Here, accuracy is very important but parents need not worry about this with the DMT 316 BLU digital thermometer. It has an algorithm that is precision-engineered to detect the slightest increase in temperature."

One important feature of the DMT 316 BLU thermometer is that it is provided with a backlight, which allows parents to use it even in the middle of the night. Parents will simply need to swipe the thermometer across the forehead of the baby or child or take a more precise measurement by ear. With the backlight, it is easy to read the temperature even when the lights are off. Furthermore, the backlight also serves as fever indicator, changing in color from green to orange and to red as higher temperatures are detected. This means that it is easy to monitor a baby's temperature during the night.

Another important feature of the baby thermometer is that it only takes one to 3 seconds to take the temperature. Thus, the baby will not even have the time to act up while his or her temperature is being taken. This thermometer is particularly helpful for parents with newborn babies up to 3 months because a fever can be very tricky at such a very young age. In fact, parents are advised to contact the doctor if the baby's temperature is higher than 100.3 degrees Fahrenheit. Furthermore, this baby thermometer is provided with a pouch for clean and easy storage.

Currently, it has an overall rating of 4.8 out of 5 stars on the Amazon page. This is because about 89 percent of the reviews are five star reviews. For instance, Gigi gave the product a five star rating and said, "This reader definitely works. There was a moment where I did not know to take off the cap to use the ear piece and tried to read the ear using the forehead reader and I was like, omg my husband has hypothermia! Ha ha. I will always prefer to use the ear now because the margin or difference is much lower than the margin using the head method. I think it's .5 versus .2 which to me is a big difference especially if you're trying to read for fever. I like how compact this is, and it comes with its own carrying case..."

iProven is a company that has been developing helpful products for the home, particularly those that are helpful for the health of family members. These products have been selected, designed and improved to comply with their clinical standards of consistency, quality, and durability, while ensuring simplicity of use by the home user.
