

# Battery Hacks Publishes Post On How To Recondition Batteries At Home

*September 05, 2019*

September 05, 2019 - PRESSADVANTAGE -

Battery Hacks, a business based in Boston, Massachusetts, has announced that they have recently published an article on how to recondition batteries at home. The article is titled, "How To Recondition Batteries ? Rejuvenate, Restore Old, Dead Car Batteries." The article addresses the fact that when an old battery is no longer functioning properly, people tend to just throw them away and buy a new one. The article explains that it is possible for people to learn how to recondition car batteries at home, including other kinds of batteries. Those who want to read the article can go over to <https://s3.amazonaws.com/battery-hacks/How-To-Recondition-Batteries.html>.

John Parker, a spokesperson for Battery Hacks, says, "Indeed, it is possible to learn how to recondition old batteries at home. With a little bit of knowledge, you can discover how to recondition car batteries at home and restore a car battery back to new! You can save a lot of money not having to buy another expensive new battery. And when you can get more life out of your batteries, you are also helping the environment! So it's a great hack to learning how to rejuvenate a car battery."

According to the article, reconditioning a car battery is really not that difficult and there are only a few things that are needed. In general, when a battery stops providing the necessary voltage, it is because the lead in the cells have all been dissolved due to electrolysis. It is also possible that the sediment that has accumulated in the lower part of the battery is preventing proper electrolysis from occurring. This results in a low output of voltage and current.

The first thing to do when learning how to recondition lead batteries is to inspect the battery by removing all of the caps or plugs at the top of the battery and then check the acid level. Just be careful when doing this because the battery contains acid, which can burn the skin and the eyes. Some amount of water must be mixed with the acid in order for electrolysis to occur and for the battery to work. The level of this liquid inside the battery should be at least one centimeter above the lead cells.

Learning how much water and acid into the battery is important. That is why, a How To Recondition Batteries

At Home PDF is available for download for more specific details. This PDF actually provides instructions on how to recondition various kinds of batteries, including car batteries, power tools batteries, gadget batteries, and more. The instructions provided have been designed to be easy to do, even for people who have no technical knowledge. To ensure that the guide is easy to understand, pictures and diagrams are provided.

The article explains that in an old or long discharged battery it has become 'sulfated' because salts of lead and sulfur have formed and adhered to the sponge plate of the negative, thus blocking the necessary chemical reactions. There are two possible methods of extending the useful life of such batteries.

The first method is applicable only for lead batteries or Pb gel batteries. The technique is to fill the battery with distilled water to reactivate the acid. Care should be taken not to touch the water that may come out of the battery because it is acidic and can cause serious burns. After reconditioning the battery, it would be time to recharge the battery in slow charge mode.

The second method is actually more effective and safe. Furthermore, it can be used for all kinds of batteries, including the alkaline domestic batteries. More information about this method can be found in the EZ Battery Reconditioning Method, which is available in PDF format. With this guide, people can learn how to save money and buy less new batteries. People can even learn how to buy old batteries, recondition them, and then sell them for profit.

Those who are interested in learning more about how to recondition dead batteries can visit the web page at [https://www.reddit.com/r/Battery\\_Hacks/comments/cwtods/how\\_to\\_recondition\\_batteries/](https://www.reddit.com/r/Battery_Hacks/comments/cwtods/how_to_recondition_batteries/).
