

iProven Reintroduces Non Contact Digital Forehead Thermometer

October 01, 2019

October 01, 2019 -

iProven, a company based in Dordrecht, The Netherlands, has announced that they have reintroduced the NCT-336 BL forehead non contact thermometer for babies, young children, and adults. For awhile, this particular thermometer from iProven was out of stock. Now, it is back in the market so that parents who have been disappointed about its unavailability can now rest assured that they can have a medical thermometer that they can use to find out if their baby has a fever or not without touching him or her. Mommies and daddies only know too well how babies can get irritable and fussy if they are sick and not feeling well.

Suzanne, a spokesperson for iProven, says, "We're really glad and excited to put back the NCT-336 BL into the market. We've heard from parents requesting for this particular thermometer and we simply cannot refuse."

She continues, "And what is really exciting is that while many people may associate a thermometer with measuring a fever, this thermometer can do a lot more! It's really a versatile tool that you can use every day, to measure the temperature of your room, your baby's bath or your little one's food."

People can use the NCT-336 BL non contact thermometer to measure the temperature of just about anything. They can simply switch it to Object Mode and then point it at an object from a distance of two to 6 inches and they'll know the temperature of that object within 2 seconds. For instance, parents may want to be assured that the baby's bath is not too hot nor too cold. Or the object may be the feeding bottle. There will no longer be any worries about how subjective their feelings can be when checking the temperature of the milk on their wrists. They can simply use the NCT-336 BL thermometer and they will know objectively that the milk is within the right temperature range.

In terms of ease of use, parents will really find it difficult to find a better one than the NCT-336 BL medical non-contact thermometer. They only have to point it at the forehead of their baby or child from a distance of 2 to six inches to determine the temperature within two seconds. Fast and accurate readings are truly convenient for parents of babies and young children. Gone are the days of waiting for a minute or two to be able to get a reading while the little one is acting up.

Also, iProven has made it sure that this digital thermometer is sturdy and reliable. As a result, parents can always depend on the readings that they get. And they can take as many temperature measurements as they want and they don't have to worry that it will suddenly malfunction. For this, it even has a 100 days money back guarantee, which means that those who are not happy with its performance, for whatever reason, can just return it within 100 days after purchase. And people can even save as many as 50 readings in the thermometer so there's no need to get a piece of paper to jot down the readings to monitor whether the baby's temperature is increasing or decreasing.

And for those nights, when babies and little kids seem to be feeling unwell, parents need not worry about waking them up while taking their temperature. It has a mute function, which prevents it from emitting any sound and it has a visible fever indication at night. When the temperature is normal, the display's backlight is green, so parents who see that can be assured that everything is fine and get back to sleep. On the other hand, the color of the backlight will be yellow if the temperature is elevated and red if there is a fever so that parents can immediately take the necessary action.

iProven is a provider of home health products just like the NCT-336 BL for caring for the health of family members. Those who want to know more about the digital forehead thermometer and other similar products from iProven can go to their website or their Amazon page. They may also want to contact them on the phone or through email.
