

iProven Relaunches Digital Baby Thermometer For Ear And Forehead

October 01, 2019

October 01, 2019 - PRESSADVANTAGE -

iProven, a company based in Dordrecht, The Netherlands, has announced that they have relaunched the TMT-215 no touch digital thermometer for babies. This is a temporal thermometer for babies and toddlers that can be used to measure their temperature through the ear or forehead. This particular digital thermometer has been out of stock for some time but it is now back in stock. This means that, once again, parents can have peace of mind in being able to check if their babies or kids have a fever in just a few seconds, without contact.

Suzanne, a spokesperson for iProven, says, "We're excited and happy to announce that TMT-215 is back in stock. With this non contact thermometer, you will know your little one's temperature in just seconds, without them even noticing."

She continues, "Parents are all too familiar with the fact that having a feverish baby or toddler can be a challenge. They will likely be fussy and irritable. Let alone if you have to measure their temperature. They won't tolerate things like thermometers touching them. That's why we have the TMT-215, which takes their temperature in a few seconds without even touching them."

With this thermometer designed for babies and toddlers, their temperature can be taken via the ear or forehead. Plus, it can also be used to check the temperature of objects. For instance, it can be used to check if the temperature of the baby's room or baby's feeding bottle is too hot or too cold. These are things that parents will no longer need to worry about.

Suzanne also wants to point out that the TMT-215 forehead and ear thermometer had undergone advanced clinical testing. This means that parents can be assured that it will offer consistent and accurate readings. They only need to follow the easy instructions provided in the manual that comes with it.

For parents who want to check if their babies or toddlers who are asleep have a fever, they don't have to worry about waking them up. The TMT-215 has a mute function to prevent it from making any sound. And even during the middle of night, when the room is dark, parents can easily see the display, whose color changes depending on the reading. The display will light up red or green, depending on whether the temperature reading is interpreted as normal or feverish. Thus, parents who are feeling groggy having awakened in the middle of the night to check on their babies need not worry about the actual reading. They only have to take note of the color of the display. If it's green, they can simply go back to sleep without any worries. On the other hand, if it is red, they will know that they need to take the necessary actions.

And parents would want to have the TMT-215 by their side at all times when taking care of their baby. This is because it can be used to measure the temperature of objects. For example, if they are feeding the baby with a nursing bottle, they can check if it is too hot or too cold. They can simply direct its probe towards the bottle and they'll know its temperature. Or they can use it to check on the baby's bath. Or they can use it to check the room's temperature.

Suzanne wants to point out that this thermometer has been designed to be durable and to last for a long time. This means that it can be depended on to provide accurate readings many times during the day. Furthermore, people who, for whatever reason, are not satisfied with it, can have a hassle-free refund within 100 days from their purchase.

iProven is a company that provides home health products like the TMT-215 for taking care of the health of family members. People who are interested in knowing more about the digital baby thermometer and other similar products from iProven can check out their website or their Amazon page. They may also want to contact them through the telephone or via email.
