

iProven Announces Availability Of The TMT-215 Digital Baby Thermometer For Ear And Forehead

October 01, 2019

October 01, 2019 - PRESSADVANTAGE -

iProven, a business based in Dordrecht, The Netherlands, has announced that the TMT-215 no touch digital thermometer for babies and kids is once again available. This particular thermometer for measuring through ear or forehead had been unavailable for some time. With so many people requesting for it, the company had done its best to make it available once more. The fact that parents can check if the baby has a fever or not without touching him or her is a convenience that they have been looking for, because it offers a hassle-free way of checking on their little one. This takes a great load off their minds, particularly with the flu season about to begin.

“Peace of mind with consistent and accurate results. That is what people have been looking for. That is why, we have hastened to put the TMT-215 back in the market,” says Suzanne, a spokesperson for iProven.

She continues, “Thanks to the advanced clinical testing that we had conducted, this ear and forehead thermometer for fever will give you consistent and accurate readings. Just follow the easy instructions in our manual!”

The TMT-215 digital thermometer has been designed for those nights when parents are worried that their baby might have caught the flu. They might have noticed that the baby was acting a bit different. As a result, they're having trouble sleeping and they go to the baby's room to check if he or she has a fever.

There would be no need to turn the lights on, possibly disturbing the baby's sleep, because the display of the thermometer is lighted. And by switching it to mute function, the thermometer will not make any sound while taking the temperature of the baby. And most of all, because it doesn't require touching the baby, the baby can continue sleeping while mommy or daddy is taking his or her temperature.

An additional feature of the TMT-215 forehead and ear thermometer that parents have found to be helpful is that the display changes in color, depending on the temperature. If it is elevated, it will turn into yellow. And if there is a fever, the display will become red. Thus, if the display is green, the baby's temperature is normal and mommy and daddy can go back to sleep relieved that their baby is safe. On the other hand, if it is red, they can then take the necessary actions.

Suzanne adds, "Having a feverish baby or toddler can be a challenge already. Let alone if you have to measure their temperature. With our non contact thermometer, you will know your little one's temperature in just seconds, without them even noticing."

The Object mode is another important feature of the TMT-215 that has some people requesting for it when it was out of stock. When in the Object Measurement mode, parents can use it to check the temperature of any object. It could be the baby's feeding bottle so that they can be sure that it is not too hot nor is it too cold. Or it can be the baby's bath. Or it could be the temperature of the room.

And then, there is the assurance that the TMT-215 will always provide accurate and consistent temperature readings. The company had done a lot of tests on the device to ensure that it is durable and accurate. And they are also offering a 100 days guarantee. This means that if the customer is not satisfied with it, for whatever reason, they can return it and have their money refunded, within 100 days after purchase.

iProven is a company that produces home health products such as the TMT-215 that people can use for take care of the health of their family members. People who are interested in the digital baby thermometer and other similar products from iProven can take a look at their website or their Amazon page.
