

DMT-316 Digital Adults And Kids Thermometer With Ear And Forehead Function Is Back

October 01, 2019

October 01, 2019 - PRESSADVANTAGE -

iProven, a business based in Dordrecht, The Netherlands, has announced that the DMT-316 no touch digital thermometer for kids and adults with ear and forehead function is once again available. The DMT-316 has been unavailable for quite some time but many people have been requesting for it. The company has responded by making it available, just in time for the flu season. Now, parents need not be worried that their kids might have caught the flu. They can easily check their temperature with the DMT-316 medical thermometer.

Suzanne, a spokesperson for iProven, says, "Do you want to know if your child has a fever fast? The DMT-316 digital thermometer can provide it to you within one to three seconds. Such speed in taking a temperature has been unheard of before."

She continues, "If you're still using thermometers that require 1 minute or even 2 minutes to provide a reading, it's time to make the switch. The conventional thermometers may not even provide accurate and consistent results. Not so with the DMT-316. It has been clinically tested extensively to guarantee that it will always provide accurate results, in just 1 to 3 seconds."

Indeed, when used in the forehead measurement mode, the user simply swipes it across the forehead and get the temperature within three seconds. For a more accurate measurement, the user takes off the cap to be able direct the probe at the eardrum and the measurement will only take one second. It has been tested to be safe and accurate for all ages.

And for those nights when mommies and daddies often worry about their kids having the flu, the DMT-316 forehead and ear thermometer offers a way to give them peace of mind. They no longer have to rely on guesswork and trying to gauge the temperature of their kids by simply touching them. If they touch their children, they might disturb their sleep. Not anymore with the DMT-316 because they can simply swipe its probe across the child's forehead, without contact, and they'll get to know if the child is feverish or not.

And it wouldn't matter whether it is even in the middle of the night. There would be no need to turn on the lights because the display of the digital thermometer has a backlight that makes it easy to read the temperature. And not only that. The color of the display will be consistent with the reading. For instance, if the temperature is normal, the display will be green. If the temperature is elevated, the color of the display is orange, and if there is a fever, the color is red. This means, there would be no guesswork at all. If the display is red, parents can take the necessary action to control the fever, and consult with a physician. If the display is green, they can heave a sigh of relief and get back to sleep because their kid does not have the flu.

Furthermore, the DMT-316 is provided with a pouch that makes it easy to keep it clean and store it away in a drawer, ready for the next use. With the flu season just starting, mommies and daddies will find that they need the DMT-316 quite frequently to check on their kids, or even themselves. An important advantage of this device is that it has been clinically tested to be safe and accurate for taking the temperature of everyone in the family, from the youngest baby to adults. And iProven even gives a 100 days guarantee, which means that within 100 days of purchase, customers can return it and get their money back if they are not 100 percent satisfied with it.

iProven is a company that provides various kinds of home health products like the DMT-316 that are useful in taking care of the health of their family members.
