

iProven Offers The FMH 139 H Cg Accurate 3pack Pregnancy Test

October 07, 2019

October 07, 2019 - PRESSADVANTAGE -

iProven, a business based in Dordrecht, The Netherlands, has announced that they are offering the FMH-139 3pack midstream test kit for pregnancy with optimal sensitivity. The company wants to point out that the FMH-139 kit provides the reassurance that women who are TTC need. From the day of their expected period, the test kit will provide the results that are over 99 percent accurate.

Suzanne from iProven says, "We are so excited to offer our Midstream FMH-139 kit to test for pregnancy that is designed to have optimal sensitivity. This hCG midstream test is what women who have embarked on their TTC journey truly require. If you get a big fat positive (BFP) result from the test, that is more than 99 percent sure. And you can even easily double or triple check it by repeating the test if you really want to make sure, because the kit has 3 test strips included in the pack."

Also, the FMH-139 midstream test for pregnancy will not keep women who are TTC waiting for long. This is because it can provide the results within 3 to 5 minutes. Users of the kit will just need to make sure that there is a control line on the right side of the window. Without that control line, the test results will not be valid. If two lines appear in the window, then the tested can be over 99 percent sure that she is pregnant.

Suzanne also wants to point out that the FMH-139 pregnancy test kit has optimal sensitivity in detecting hCG, the pregnancy hormone. It has a sensitivity of 25 mIU/ML, which means that women on their TTC journey can really depend on its accuracy.

The FMH-139 midstream pregnancy test kit has been designed to be used on cycle day one, which is when women who are trying to conceive would expect their next cycle to begin. The key reason that the company had designed a test kit that is more than 99 percent accurate on cycle day one is that women who are trying to get pregnant will have to wait for 14 days or two weeks in order to be able to take the test to determine if their efforts to conceive have finally been successful. This is because it takes that amount of time for the body to produce human chorionic gonadotropin (hCG) that is enough to be detected in the urine. There would be so much disappointment if they get false positive results.

It is only after the embryo has traveled to the uterus and attached itself to the uterine wall that the body will produce hCG. Therefore, the FMH-139 pregnancy test kit can only be used to detect hCG in the urine after two weeks. The company has ensure through a number of tests that the FMH-139 is more than 99 percent accurate when the test kit is used on cycle day one.

It should also be noted that the FMH-139 is provided with a pink cap. When this is moved to the white end, it will make the testing easier. This is because it will lengthen the test kit so that the tester can avoid getting urine on her hand while keeping the test in her urine stream.

It is also important to ensure that tester has clean hands before doing the test. After ensuring that she has clean hands, she will just need to put the pink cap on the other end and then direct her urine stream on the test strip for 10 seconds and then put the cap back on. After three to five minutes, the results will appear on the strip. And if two lines are evident on the strip, she is more than 99 percent sure that she is pregnant.

iProven is a popular developer and provider of home health products for the different members of the family. Those who are interested in learning more about the FMH-139 hCG pregnancy home test kit or other similar products can visit the company?s website or their Amazon page.
