

Accurate FMH 139 3pack H Cg Pregnancy Home Test Kit Released

October 07, 2019

October 07, 2019 - PRESSADVANTAGE -

iProven, a company based in Dordrecht, The Netherlands, has announced that they have released the FMH-139 3pack test kit for pregnancy that has been assured to provide maximum sensitivity. The FMH-139 midstream test kit assures women who are trying to conceive (TTC) that they can rely on the results that it provides. When used on cycle day one, which is the first day of their next expected period, the test kit will provide results that are more than 99 percent accurate. This means that if the results are positive, the tester is more than 99 percent sure that she is pregnant.

The FMH-139 midstream test kit for pregnancy has also been designed not to keep women who are TTC in suspense for a long time. The results will be seen on the test strip in only just three to five minutes. They will just have to ensure that a control line is present on the right side of the test window. If there is no control line, the test results are invalid. But when there are two lines in the window, congratulations are in order because she is over 99 percent sure that she is pregnant.

Suzanne, a spokesperson for iProven, says, "We have released the Pregnancy Test Midstream FMH-139 kit. From the day of your expected period, the pregnancy test will give you results over 99% accurate. Plus, the

pregnancy test midstream does not keep you waiting long. It shows rapid results within 3 to 5 minutes. If the test shows a single control line, the test is negative and you are not pregnant. If the test shows two lines, a control line and a test line, the test is positive and you are pregnant. Congratulations!?

The FMH-139 midstream pregnancy test kit is to be utilized on cycle day one, which is when women who are trying to conceive would expect their next cycle to start. The test kit has optimal sensitivity in detecting the pregnancy hormone hCG. Specifically, it has a sensitivity of 25 mIU/ML, which is sufficient to ensure over 99 percent accuracy.

The primary reason that the company had developed a test kit that is more than 99 percent accurate is to make sure that women who are TTC will not be severely disappointed in the event that they get a false positive result. For some women, especially those who have been waiting for a long time to have a baby, a false positive is a disappointment that they'd not rather not have. With over 99 percent accuracy, there is minimal risk that there will be a false positive result.

It actually takes 2 weeks or 14 days from the date of conception for the body to produce enough of the hCG pregnancy hormone to be detectable in the urine. This is because after getting fertilized, the egg has to move to the uterus and attach itself to the uterine wall. It is when it is able to do this that the body creates a substantial amount of hCG that is needed for the pregnancy process to unfold. Imagine having to wait that long, only to get a false positive result.

Also, for the convenience of the tester, the FMH-139 test kit has a pink cap. She will just need to transfer this cap to the other end to lengthen the test kit so that there will be a bigger clearance between the urine stream and her hand. And before doing the test, she is advised to wash her hands to avoid any contamination. In performing the test, she only needs to put the test strip under her urine stream for 10 seconds. After just three to five minutes, the results will appear on the test strip. If there are two lines, it is time to celebrate because she is is pregnant and that is over 99 percent sure.

iProven is a company that develops home health products that are designed for various members of the family. People who would like to know more about the FMH-139 hCG pregnancy home test kit or other products offered by iProven can check out the company's website or their Amazon page. Or they can contact them on the telephone or through email.
