

iProven Reveals That The FL 35 Ovulation Home Test Strips Are Now Available

October 07, 2019

October 07, 2019 -

iProven, a company based in Dordrecht, The Netherlands, has revealed that the iProven FL-35 test strips for detecting ovulation are once again available. This kit contains 35 test strips and they have been unavailable for a certain period of time because of the high demand. They are now excited to announce that they have them back in stock. These test strips are designed to help women who are trying to conceive (TTC) by allowing them to know when they are most fertile. What these strips can do is detect the presence of the luteinizing hormone (LH) in the urine. A surge in this hormone is what initiates ovulation about 24 to 36 hours later. Thus, knowing when there is a surge in LH allows women to get an insight into when they are most fertile so that they can maximize their chances of getting pregnant.

It should also be noted that iProven has included two pregnancy test strips in the FL-35 kit. This is important because women who are TTC will naturally want to know if they have really become pregnant. These pregnancy test strips are designed to detect the pregnancy hormone, hCG, in the urine. They have been tested to be more than 99 percent accurate, which means that the chances that they will provide a false positive result is minimal. These pregnancy test strips are to be used on cycle day one, or the first day of the next menstrual cycle. Two lines will mean that it is time to celebrate because she is finally pregnant.

Suzanne, a spokesperson for iProven, says, "You will certainly need these ovulation test strips, whether you've just started trying to get pregnant, or you've been trying for quite some time now. You need not worry because the strips in our ovulation test kit have an accuracy of 99%. You'll be certain to find that particular moment in time when you should do the baby dance."

It is important to note that women's bodies are different from each other. Some women will have a positive LH-test during their whole 28-day cycle. What will indicate that moment in time when their ovulation day draws near is a darkening of the test line. On the other hand, some women will just see a faint second line appear on the test strip, which indicates that their body is experiencing the LH surge. In both cases, what is important that women know what is going on in their own body. Detecting the LH surge, which is what would trigger ovulation after 24 to 36 hours, helps women who are TTC time their baby dance to maximize their chances of becoming pregnant.

Using the FL-35 test kit is quite easy. Those who want to know if their ovulation day is near should get a clean container in the morning and collect some urine in it. Next, they will dip a test strip in the urine for five seconds. They will then wait for three minutes, after which the results will appear on the strip. As mentioned previously, they will need to check on the manual on how to interpret the results. For those who have been using this kit for some time, interpreting the results will be quite easy.

Meanwhile, women who are TTC are advised to do the test twice a day in order to be more accurate in determining the moment of ovulation. With 35 ovulation test strips include in the kit, this is easy to do. And once the moment of ovulation has been determined, women who are TTC can time their baby dance to optimize their chances of falling pregnant.

iProven is a home health products business that develops products that provide people an insight into the health of various members of the family, including themselves. Those who are interested in the FL-35 LH strips or other similar products from iProven can visit their website or their Amazon page. Or they can call them on the phone or contact them via email.
