

Boiler Installers Company In London Offers Suggestions On How To Keep A Home Safe

August 06, 2015

August 06, 2015 - PRESSADVANTAGE -

LB Plumbing and Heating, a boiler installers London company, has recently released a blog post outlining various boiler installation and maintenance tips designed to keep a property safe. Boilers are vital elements in a person's home, but they also have the potential to be dangerous. With this, the company wants to ensure every home using boilers is safe.

Ray Le Blanc from LB Plumbing and Heating says, "Gas boilers are an important part of any home in North London and anywhere else in the U.K. They are the main source of heat for cooking meals, staying warm on a cold night, or having a nice relaxing bath. However, despite their usefulness, gas boilers could become faulty if you don't take care of them properly. To avoid that risk, including the possibility of carbon monoxide poisoning, we have released a number of useful hints and tips to help keep people safe."

The first and most important tip that is provided is that the installation should be completed by a professional company. The only legal boiler installers London has to offer are those that employ Gas Safe engineers. People can - and should - always check whether their engineer is registered or not.

Secondly, regular maintenance is vital. And the maintenance work should also be done by Gas Safe engineers. These engineers should periodically check to see if the boiler is operating at the appropriate settings. In addition, they should ensure that all safety devices are functioning properly and that nothing is blocking the various vents. Furthermore, all dwellers should only use the boiler for its intended purpose.

Finally, the boiler installation North London company explains that it is essential to be always on the lookout for possible carbon monoxide emissions. At least 50 people each year die due to carbon monoxide poisoning. Carbon monoxide is known as the 'silent killer' because this particular gas is odorless. It is a good idea, therefore, to have a carbon monoxide detector installed next to gas appliances. This device should provide an audible warning when it detects the presence of the poisonous gas so that the homeowners can do what is necessary to remedy the situation.
