A Psychiatric Hospital Explores The Effects Of Publicity On Forensic Psychiatry Patients

November 18, 2019

November 18, 2019 - PRESSADVANTAGE -

Scott Reichlin MD, a forensic psychiatry specialist based in Salem, Oregon, shared a new article on the effects that negative publicity has had on forensic psychiatry patients. In his articles, he discusses the stigma that these patients have to live under since public perception universally identifies them, incorrectly, as criminals.

The article, titled "Effects of Publicity on a Forensic Hospital," explores how these facilities have changed for the worse over the past few years, especially in Oregon. Forensic psychiatry hospitals in the state have undergone many changes and major reformations following an incident where a patient escaped. Even though the patient was re-arrested shortly after their escape without further issue, this event caused an uproar that was escalated by the press, generating general discomfort among Oregon residents regarding the administration of public mental health systems, especially when they deal with forensic psychiatry.

The negative press coverage that took place on a daily basis on the months following the event led to major reforms in the forensic psychiatry system, affecting many more aspects of the facility in addition to their security. Today, years after these reforms, Dr. Reichlin states that forensic psychiatry hospitals have more in common with a prison than a care facility, and the view that society has of their patients is that of individuals who are embarrassing, offensive and even a danger to themselves and other people?despite the fact that forensic psychiatry hospitals have proven to be extremely beneficial for both patients and their loved ones.

Dr. Reichlin states, "Most people describe forensic psychiatry patients as being ?criminally insane,? illustrating the stigma this group of patients faces in society. The negative impact that this has on the way mental conditions are treated is immeasurable, and it also affects the patient's ability to reintegrate into society after their treatment is completed. Furthermore, this negative view affects the state of security in forensic psychiatry institutions, as it is usually treated with paramount importance. These institutions have complex procedures and policies that are designed to ensure those who reside and work in these places remain safe, and that there is little chance of patients escaping."

The restraints and prohibitions that are put into place to prevent patients from escaping consequently have a

widely negative impact on the efficiency of any treatments they undergo. Dr. Reichlin states that finding a

balance between security and the treatments that each patient requires is difficult, and this issue is not given

as much consideration as it is due in Oregon forensic psychiatry institutions.

The article continues, "In a hospital, there is a tight level of security measures to prevent an escape, and they

usually come at a great personal cost to patients. This cost usually arises in the limitations on how they can

smoothly integrate back to society once their treatment finishes. Most forensic patients lack the basic skills

needed for proper and harmonious living in a community, such as choosing friends as well as budgeting and

planning their time and cash. To learn these skills, patients usually need guidance as well as some exposure

to real-life community experiences."

Dr. Reichlin states that it is this community-like experience that the forensic psychiatry hospitals in Oregon

lack, as it is nearly impossible to create a balance between the security measures required and the therapy

needed. Over the course of the coming years, the decay in the quality of the treatment offered will become

much more evident as patients who complete their programs will struggle to reintegrate themselves into

society and live a normal life.

A more thorough study of the effects that the decay of the forensic psychiatry health care system has on

patients is available on Dr. Reichlin?s website. He has published a nine-page paper thoroughly discussing

the effects of publicity on a forensic hospital. He states that he seeks to raise awareness about this issue that

is currently affecting thousands of mentally-ill patients in Oregon. Interested parties are therefore welcome to

contact Dr. Scott Reichlin to follow up on any inquiries they may have on the subject.
