Blue Organix, a business based in Valrico, Florida, has announced that they have launched a product for psoriasis treatment, which is the Samambaia liquid extract direct from the Amazon Rainforest of Peru. This is a 100 percent Polypodium decumanum extract for scalp, plaque, face, eye, ear, hair, and skin psoriasis treatment. It is an all natural herbal OTC plant product and it is offered with a 60 day money back guarantee.

Peter Humleker, founder of Blue Organix, says, "We're happy to announce the availability of the Samambaia liquid extract, which is a newly discovered natural psoriasis treatment in the United States. We are also a corporate supporter of Operation Underground Railroad. Every time you buy our products you are helping to fight human trafficking, most of which are children. A portion of our proceeds go to help fight for children who are being trafficked for very sinister purposes. Thank you for helping us end human trafficking."

Like most ferns, the Samambaia plant has an elaborate and intricate root or rhizome system. Its rhizomes, fronds and leaves have been often used by the native Amazonian tribes for thousands of years in order to remain healthy and to treat psoriasis. The Samambaia plant contains several nutrient-dense compounds, such as antioxidants, alkaloids, lipids, essential fatty acids, and more.

The Samambaia extract has been studied as a treatment for problems with plaque psoriasis, including face, scalp, ear, eye, oral and overall skin psoriasis. This is an OTC product that has been used by adults, children, babies, and even dogs.

In the Amazon forest, the native Indians have been using macerations of the rhizome for various diseases, such as tumors, rheumatoid arthritis, psoriasis, whooping cough, and kidney problems. However, in the U.S., it is mainly used for psoriasis.

Among the lipids found in the Samambaia extract is a group of chemicals known as sulphoquinovosyldiacylglycerols. These chemicals have been studied and patented as one of the "active" chemicals of the Samambaia. Toxicity studies have also been conducted for the Samambaia extract with mice and rats and it was concluded that there was no toxicity in both acute or chronic dosages. In humans, studies have shown no toxicity for oral doses of more than 1000 mg.

The mechanism for the extract's ability to treat psoriasis has been found to be linked to the modulation of cellular processes that occur in inflammation and psoriatic skin. Scientists have discovered that psoriatic skin has unusually high amounts of leukotriene and platelet-activating factor (PAF). These chemicals have been linked to the cause and progression of psoriasis.

In clinical studies, it was found that the Samambaia extract was effective in blocking excessive production of leukotrienes and PAFs.

Psoriasis has also been found to be an autoimmune disease because many of the immune cells are overstimulated, while others are suppressed. The Samambaia extract was found in clinical studies to have certain immune modulating effects that can treat the imbalances in the immune system that are specific to psoriasis. It has also been documented to possess anti-inflammatory activity in rats, mice, and humans with psoriasis.

Studies have shown that the Samambaia extract is an immunomodulator, an antipsoriatic, a cough suppressant, an anti-inflammatory agent, and a neuroprotective agent. It is mainly used for psoriasis and other skin conditions but scientists are also studying possible uses with other diseases, including Alzheimer's disease.

There is one contraindication, which is that it may enhance the effects of the heart drug, digitalis. Thus, people who are taking digitalis or have any heart condition are advised to consult with a qualified health practitioner before using Samambaia.

Blue Organix is a company that was founded by Peter Humleker, who is also a United States Marine Corps veteran. The company specializes in herbal supplements that provide natural relief. They also focus on rare herbs found the Amazon Rainforest, Russia, India, and parts of Asia.
