

Richardson Pain & Wellness Launches New HGH Therapy

December 13, 2019

Richardson, TX - December 13, 2019 -
Richardson Pain & Wellness, based in Richardson, Texas, has announced that they have launched their human growth hormone (HGH) therapy service. They are offering synthetic HGH injections for anti-aging treatment and mitigation of pain. However, because there are some risks connected with the treatment, it is vital for a patient to be evaluated by the clinic?s team. They will also conduct an in-depth discussion with the patient regarding HGH treatment before proceeding with it.

A spokesperson for Richardson Pain & Wellness says, ?You have many glands that make necessary hormones in your body. For example, your body produces a growth hormone naturally and continuously throughout your life, signaling growth in your bones and muscles. However, over time (i.e., basically when you reach middle age), the production of this hormone slows down and causes loss in muscle and bone mass, among other unpleasant signs of aging.?

The human growth hormone, according to studies, has an impact on height, as well as the building of bones

and muscles. It is essential in growth as well as in several other processes in the body, including muscle mass, bone density, and mood. The levels of growth hormones in the body can change throughout the day and physical activity is a contributor to this. Exercise and similar activities can cause HGH levels to increase naturally. Stress, sleep and low blood sugar levels can also contribute to the rise in the hormone?s levels.

Deficiency in HGH can result into a number of problems. These include anxiety and depression; increased risk of stroke and heart disease; increased fat around the waist; weak muscles and bones; weak heart; reduced ability to think; tiredness; and more. Some conditions may also benefit from HGH injections. These include Parder-Willi syndrome, Turner?s syndrome, chronic kidney disease, and Noonan syndrome.

Richardson Pain & Wellness also offers testosterone replacement therapy. This involves increasing the testosterone levels in the patient. It is given to patients who believe they are testosterone deficient. Most physicians consider a testosterone level of 300 to 1000 nanograms per deciliter as the normal range, which means anything below 300 is considered to be insufficient.

Testosterone is know as the ?male sex hormone? and its primary role is the development of men?s sexual characteristics. In addition, this hormone can also have an impact on a person?s physical and psychological state. It was also found that having a normal level of testosterone can result in maintaining a good health condition. For instance, it can reduce the risk of getting high blood pressure and heart attack. Unfortunately, the body?s production of testosterone declines with age. It usually reaches its highest level at late twenties and then gradually declines ever year, which slowly results into a number of aging problems.

There is a growing awareness of the role of testosterone deficiency in aging and this is made evident by the increasing interest in testosterone replacement therapy. However, while testosterone replacement therapy offers several advantages, it can be dangerous if it is not properly used. This is because it has been found to be linked to sleeping problems, lipid abnormalities, and some other illnesses. Thus, it has to be administered by an experienced and licensed physician.

If testosterone replacement therapy is administered properly, it can have several benefits. These include improved positive moods, such as calmness, friendliness and wellness; improved sexual functions; decrease in fatigue and tension; increased bone strength; increased body mass; increased energy level; and improved mental functions.

Meanwhile, Richardson Pain & Wellness can also offer hormone replacement therapy for women. This is usually to relieve symptoms of menopause, such as dry skin, sleeplessness, vaginal dryness, bladder problems, and hot flashes. Here, estrogen and progesterone are provided as pills, skin patches, or vaginal creams. Studies have also shown that hormone therapy will not only decrease menopausal symptoms but also the risk of osteoporosis, while also lengthening lifespan.

Those who are looking for an HGH therapy clinic can check out the Richardson Pain & Wellness website or contact them through the phone or via email.
