

Flaskdata.io Announces Partner Program

April 27, 2020

April 27, 2020 - PRESSADVANTAGE -

Flaskdata.io, a Modiin, Israel based tech startup that saves 3-6 months in clinical trial completion, has just announced the launch of their new Flaskdata partner program. "We are actively seeking business partners in the global life science clinical trials market," the company says.

They are looking to work with four types of business partners: customer developer partners, CRO partners, embedded API partners and design partners. Customer developer partners come with strong sales skills and deep knowledge along with great access to a particular medical device vertical (like esthetics). The kind of partners Flaskdata.io is looking for are those who want to grow their revenue using innovative Flaskdata.io products for patient compliance automation. Flaskdata.io pays commissions on referrals and residuals on subscription renewals.

Flaskdata.io is also looking for boutique CRO companies that specialize in medical device clinical trials and want to get an edge on the competition through the utilization of innovative technology. Furthermore, they hope to work with Embedded API partners who use the Flask API to create new applications that run on mobile and desktop devices as well as medical Internet of Things (IoT). The fourth and final type of business partner that Flaskdata.io is looking for is design partners. A design partner will have early access to the company's automated detection and response technology and will work with their data science team to

enrich and extend the capabilities of the Flask AI.

“The Israeli life science industry is special not only for its ground-breaking innovations but also for not having a domestic market for its products,” Flaskdata.io states. “Without a domestic market, Israeli life science companies must innovate locally and work globally in their clinical research, manufacturing, sales and marketing. This creates an ideal proving ground for Flaskdata.io to develop battle-proven products for the global clinical trials monitoring industry. We collaborate with our partners to develop business-innovating locally and working globally. If you want to grow your business and work with a tech company that thinks differently about managing clinical trials, then we want to talk to you.”

Flask can be scaled to any-sized trial and sustains procedural adherence and verified-data. The platform offers real-time data collection and automated detection and response. The software fits very easily into digital health, digital therapeutics or eClinical software. Flaskdata.io is able to aggregate data from any combination of sources, including investigators, patients, mobile, wearables, passive monitoring and much more, making it possible to create a very comprehensive, and therefore useful, database.

“The Flaskdata.io platform is a complete solution for decentralized clinical trials, patient-centric interventions, digital therapeutics and site-less trials,” says Flaskdata.io’s. “The platform integrates EDC, mobile ePRO and connected devices using a continuous data feed. The Detect & Respond sub-system processes the continuous data feed to provide an immediate picture of protocol compliance for your research. Automated playbooks provide adaptive reinforcement messages for patients in their own time and treatment frame and help them achieve high levels of adherence.”

A number of companies and institutions have made great use of the Flaskdata.io platform for a variety of applications. For instance, Flaskdata.io reports that, “Exalenz Bioscience Ltd. develops and commercializes advanced medtech systems that extract vital information for diagnostics from subtle changes in the patient’s exhaled breath based on its BreathID technology platform. These products improve the quality of patient care, enhance clinic and medical centre efficiencies and fuel revenue generation. Exalenz proprietary core technology enables medical specialists to identify and manage specific digestive and liver conditions with unprecedented ease, patient comfort and clinical precision. Exalenz used Flaskdata.io as a highly cost-effective solution to manage and monitor their portfolio of global multi-centre medical device clinical trials at a large number of medical centres in Western Europe, the United States and Israel.”

Those interested in what Flaskdata.io has to offer are encouraged to contact the company’s customer representatives for more information. The software platform has seen successful deployment in a number of fields, and COVID-19 vaccine developers will find it an important tool in going faster to market. The partner

program is also an excellent opportunity to work on and around an innovative piece of software that may revolutionize the industry. Reach out to the company at the following link to learn more: [Contact For More Information](#).
