

## **Neighbors HVAC: When To Utilize Heating And Air Repair Services In Murrieta**

*November 02, 2020*

November 02, 2020 - PRESSADVANTAGE -

Neighbors HVAC, based in Murrieta, California, is reaching out to the wider community to share important insight on when they should service or repair their HVAC systems. According to the company, while HVAC repair and maintenance should always be left to the professionals, homeowners should know enough about their HVAC systems and when to service or repair air conditioning units so they may save on time and expenses. Learn more here: [Air Conditioning Murrieta](#).

The first and most obvious set of details an owner should be aware of is the brand name, make and model of the HVAC system. Knowing what brand, make and model one's system is will help homeowners better understand its operation type and allow them to contact the right professionals when something goes wrong. In addition, it is a fact that not all brands are created equal, so knowing the ups and downs of the model one has will help prevent them having to replace the whole system earlier than necessary.

Knowing these details is just the start. Homeowners should also be aware of their system's operation type. The company makes it clear that HVAC systems are flexible by nature and constantly evolving, which means that there is a wide variety of heating and air conditioning systems on the market. Some of these types

include the traditional central air conditioning and furnace combination, which have high efficiency, variable speed heat pumps (that can both cool and warm a home). Another type is the ductless mini-splits or even geothermal heating and cooling. Knowing exactly what kind of HVAC system a home has will also help homeowners get the right kind of maintenance. The company also recommends that homeowners make note of how old their system is. While acknowledging that this will be harder on those who live in a home or condo that had the system installed before they moved in, having an estimate is still a wise practice. Since older systems have outdated technology in comparison to modern ones that are more energy-efficient and do a better job of heating and cooling, systems older than 5-10 years might need to be replaced. Older systems must also be serviced regularly, and professionals will be able to give a homeowner an approximate period of when to do so.

The company points out that, if the home and HVAC system is relatively new, there is no need to worry about a full replacement. However, homeowners should be aware of its maintenance history. If the homeowner notes that there are frequent issues, it might be a sign of larger problems or poor maintenance. Knowing the unit's maintenance history will also be of help to the HVAC company that eventually works on repairing or maintaining the system. Ideally, a homeowner should include air filter replacement dates in their maintenance history in order to ensure that they never miss a filter swap in their home. Being aware of the system also means one will be able to send for professionals in a timely manner. Click here for more information: [Heating and Air services Murrieta](#).

Being aware of such factors would enable a homeowner to spend only what is needed to maintain and repair their HVAC systems. Repair costs will often depend on the cost of the part that is damaged or needs replacing. For example, the average cost to replace a capacitor in an air conditioning unit may range between \$150-250, and it varies depending on the size and capacitor rating. A homeowner will also incur costs for additional service, such as service call, system diagnostic or clean and check.

Another common part that needs servicing and replacing is the fan motor in an air conditioning unit. On average, it may be somewhere within \$250-450 depending on the model and brand. One must note that most heating and air conditioning companies can replace any brand of fan motor. It is also important that a homeowner ensures their units are registered with the company warranty in order to ensure servicing and repairs at minimal cost.
