

## **Air Conditioning Edmonton Expands Service Area to Sherwood Park Alberta**

*January 11, 2021*

January 11, 2021 - PRESSADVANTAGE -

Air Conditioning Edmonton, or AC Edmonton, is pleased to announce that they have recently expanded their service areas to include Sherwood Park, Alberta, Canada and neighbouring areas. The company offers heating, ventilation, and air conditioning installation, repairs, and maintenance services to help homeowners make sure that their HVAC systems would be functioning effectively around the clock. They also provide replacement, installation, repair, and maintenance services for air ducts and wiring that are used for air conditioning systems.

Dwight Gropper, President of Air Conditioning Edmonton, says, "If you want to keep your HVAC system working properly and effectively, then we suggest that you regularly schedule maintenance service for both your heating and cooling. We also provide customized wiring and duct solutions on top of the standard AC services we offer. We do everything, including AC maintenance, replacements, and installations, and duct repairs, inspections, and installations."

Air Conditioning Edmonton offers various kinds of HVAC services. These include: air conditioner installation, air conditioner tune-up, air conditioner repair, furnace replacement, boiler repair, furnace services, HVAC

replacement, and central air conditioner services.

They want homeowners to know that there will come a time when air conditioner installation becomes necessary. For instance, if the AC unit is more than 10 years old, it is advisable to install a new one because the new energy certifications for the new units may allow savings in energy bills of up to 20 percent annually. While it is true that the life of an AC unit can be extended by doing certain things like changing the filter at regular intervals and cleaning the dust and debris from the interior parts, the average life of an AC unit is between 15 to 20 years. Those who require AC installation may want to visit AC Edmonton website.

Meanwhile, they want to point out that an air conditioner tune-up is a necessity. They recommend that once the snow has finally melted and spring starts, it is important to schedule an AC tune-up to ensure that it will be effective in providing the cooling requirements during spring and summer. There are various reasons why an AC tune-up is required. These include: ensuring that the AC unit is safe to run; improved air quality; lower utility bills; increase in the lifespan of the AC unit; and peace of mind in the knowledge that the house will be cool even if the temperatures reach the 30-degree range.

If the air conditioner appears to be not working properly, it is time to call the professionals from Air Conditioning Edmonton to have the AC unit inspected and the experienced technicians will troubleshoot the unit and determine how to solve the problem. During winter, furnace repair is vital for the safety of the house residents as well as to prevent damage to electronics and plumbing fixtures. During summer, air conditioning repair is a necessity for the safety of the elderly as well as pets.

During the cold season, gas and oil furnaces are essential to ensure a comfortable home or office. Furnaces provide an easy way to heat rooms and offices and can easily be controlled in one central location. While furnaces tend to be long lasting and requiring very few repairs, they will not last a lifetime and there will come a time when they will need to be replaced. For those who require furnace replacement, the technicians from Air Conditioning Edmonton are ready to offer their services. Things to consider with a furnace replacement include the cost, compatibility with the old unit, warranty, sophisticated controls for the new unit, the speed of installation, and the company that will supply the new furnace unit.

Air Conditioning Edmonton also offers repair services for water boilers, which are used by homes as source of hot water and heat. While boilers are durable and long lasting, they are constantly under stress due to heat and pressure and will likely have issues, such as the unit not turning on, radiators that are not heating, noisy operation, constant loss of pressure, and pilot light constantly turning of.

Those who are interested in learning more about the HVAC services provided by Air Conditioning Edmonton

may want to check out their website at <https://air-conditioning-edmonton.ca>, or contact them on the telephone or through email.
