What Is A Cryptocurrency?

Digital Currency Future Has Released Information Which Answers The Question: What Is A Cryptocurrency?

October 26, 2015

October 26, 2015 -
Digital Currency Future, a business based in Chittenden, VT, has released new educational information to the public to assist people with understanding cryptocurrency. Their goal is to provide education, news and information to empower people to remain safe with their finances. In so doing, they will ensure people no longer become the victim of a failing central banking system. By answering the question 'what is a cryptocurrency', people receive more knowledge, and knowledge is power.

"What is cryptocurrency?" says Caleb Wright from Digital Currency Future. "That is probably the question I am asked most often on a daily basis. And I am glad people are asking it, because it means they are starting to wake up to the fact that they can make their own, and much improved, financial decisions. Very simply put, cryptocurrency is digital, rather than physical money."

When people ask 'what is cryptocurrency', they often also want to know why they should be interested in it. According to people like Caleb Wright, the current global banking system isn't safe anymore. This has also been confirmed in the Success Council Newsletters, which is generally regarded as the authority source on all things future financial. They have warned that people have believed that their money is safe since new federal rules on banking were introduced after the great depression. However, this now seems to be going through change.

"The Success Council Newsletters have cited five reasons why the current banking system is no longer safe, and I agree with these reasons," adds Caleb Wright. "They cite the Cyprus bank theft example, where people in Cyprus lost up to half of their life savings due to bad banking decisions. The other examples they show are equally worrying in terms of the state of our banking system."

The newsletters also explain to people that banks don't actually hold money. This is due to fractional reserve banking. Then, there is the issue around quantitative easing, which actually leads to massive inflation. Banks also have various regulations and limits in place that dictate how people can access their own money. Finally, banks are being bailed in with tax payers' money. People who ask 'what is a cryptocurrency' should know, basically, that it is a way for them to be in full control of their own money and gives them a 'Plan B' to protect their finances against the effect of future bank failures.
