

IV Solution & Ketamine Centers of Chicago Offers Anxiety Treatment in Chicago

August 16, 2022

CHICAGO, IL - August 16, 2022 - PRESSADVANTAGE -

IV Solution & Solution

Various studies have revealed that ketamine blocks the cellular NMDA receptor, which is a neural receptor for glutamate that has been observed to play a key role in major depression, fibromyalgia, chronic pain syndromes, and other conditions. It has also been found to have possible anti-inflammatory characteristics and can stimulate neuronal growth, neuroplasticity, and synaptogenesis. However, it is important to note that ketamine is a Schedule III drug that can only be used and administered by a nurse anesthetist, a licensed anesthesiologist, and trained physicians.

Anxiety disorders are some of the most common mental health issues in the country. Individuals of any age can suffer from any of a broad range of crippling anxiety disorders, such as panic disorder, post-traumatic stress disorder (PTSD), phobias, and other mental health issues involving anxiety as a key and distressing symptom. Meanwhile, ketamine has been used as an off-label treatment for depression since the 1990s. And unlike regular depression treatments, which are focused on increasing the brain chemicals that enhance a patient?s mood, ketamine is used to repair neuron synapses and boost the level of glutamate in the brain, which provides quicker results compared to antidepressants. Those who would like to know more the ketamine center can check out their latest press release article.

It has been observed that anxiety and depression always go hand in hand and one explanation for this is that both disorders are linked to abnormalities in the glutamate system. Drugs, such as ketamine, that change the glutamate and gamma-aminobutyric acid (GABA) systems, are therefore effective for the treatment of both anxiety and depression. Scientists are still not sure as to how ketamine can alleviate anxiety and depression, but what they do know is that ketamine can work almost immediately and can offer long-term symptom relief, while antidepressants will need weeks before they can alleviate symptoms.

In ketamine intravenous (IV) therapy, a carefully dosed infusion of ketamine is given to patients in a healthcare facility. Their protocol for depression typically requires six ketamine infusions in a span of two weeks and then maintenance infusions are provided every month or every few months. Each infusion will last for approximately less than one hour. Each session is not expected to have any residual effects on discharge but they insist that patients do not drive home.

When compared to traditional antidepressant medications, ketamine will offer relief from depression for up to 80 percent of patients with TRD. In contrast, oral antidepressants may only be effective in approximately 60 percent of patients and have several unwanted side effects.

IV Solution & Solution

Those who would like to know more about IV ketamine therapy as a possible treatment for anxiety and other

mental health disorders and also in getting the latest news about this can check out the IV Solution & Examp; Ketamine Centers of Chicago website, or contact them on the telephone or through email.
