

Illuminex Lighting Announces That Their Industrial LED Lighting Products Can Help With Pest Control

March 31, 2015

March 31, 2015 - PRESSADVANTAGE -

Illuminex Lighting has shown the world again how their lighting is about more than just illumination by announcing that their industrial LED lighting products can help with pest control. The agricultural industry has long been using LED bulbs in egg and milk production, as well as enhancing the health of livestock. Now, it seems that it can also help control pests and this fits in perfectly with the overall philosophy of Illuminex Lighting.

"At Illuminex, we believe in truly changing the world for the better," explains Dennis Gronbeck. "We focus strongly on sustainability and eco-friendly energy. Learning that our industrial LED lighting can help with pest control means the agricultural industry could move away from using harmful pesticides at last."

Pesticides are highly controversial. Although farmers need them to sustain their crops, they have unwanted effects on the environment and on health. Indeed, the link between pesticides and various health conditions has been well-documented. Now, farmers can rely on these LED lighting products to control pests in an environmentally and socially conscious way.

Light-based pest control, offered through fiberoptic LED lighting, is a new development that has been developed by the Lighting Science Group Corporation and Global Good. What they discovered is that they can create an LED light fence to attract and dispose of pests.

"Essentially, the LED fence works just like a bug zapper," explains Sarah Emory from Illuminex Lighting. "The light is attractive to various pests, but when they come to the fence, they will be burned to death. As such, the crop is protected, as is the overall health of the general public."

At the moment, the idea is still in the development stage, but Illuminex Lighting wants to be right there when it becomes reality. It will be a way of revolutionizing the agricultural industry in such a manner that is beneficial to the whole world.

If the project does work, it could have very far-reaching effects. It would allow food to be grown in more places, which in turn means that global hunger could be reduced. Additionally, there will be less illnesses and diseases, as people will finally be able to eat truly good and wholesome foods. Although this may sound idealistic, it fits in exactly with the overall vision and philosophy of Illuminex Lighting. They want to make the world a brighter place, but not just by providing light. Their goal is to make sure that their lights actually contribute to changing the world for the better.

Illuminex has been at the forefront of LED lighting development since the start. They are known for their superb quality and ethical working standards. Additionally, all their products are made in this country, as they believe in supporting the local economy as well.
