

Acme Concrete Provides Driveway Leveling and Garage Floor Repairs in Illinois to Repair Ground Settling Effectively and Durably

June 19, 2023

June 19, 2023 -

Crystal Lake, IL: Acme Concrete Raising & Repair offers lasting solutions for settled concrete on residential, commercial, and municipal premises across Chicagoland. Its cutting-edge Smart Lift System raises the driveway or garage floor and guarantees a solid support structure to withstand heavy loads. The business's seasoned technicians are fully committed to providing top-notch customer service, ensuring every job is completed to perfection.

According to announcements released by Acme Concrete Raising & Repair, Inc., this garage floor leveling and garage floor repair business identifies uneven surfaces, cracks, water pooling in unwanted areas, and bumpiness as signs of ground settlement- a serious problem that requires immediate attention. It strongly recommends that property owners level and repair concrete driveways immediately to avoid further damage.

The business understands that the stability of driveways largely depends on having a proper subbase to support heavy slabs and designated loads. Inadequately compacted or poorly designed subbases lead to settlement issues and a loss of slab stability, which worsens over time.

When subbases fail, concrete becomes stressed from traffic weight and ultimately fails, causing cracks and slabs to drop. Water also fails to drain correctly, and driveways may lose alignment with curbs and sidewalks. For safety and damage prevention, it is crucial to lift sunken concrete on driveways and garage floors.

Acme Concrete presents an economical, quick solution to fix sinking concrete driveways and garage floors. Its cost-effective Smart Lift System is designed to level joints, correct pitch, and fill voids under slabs, providing optimal support for heavy loads.

This is a specialist concrete repair company with the expertise to repair any damaged concrete slab, from an

uneven garage floor down to an unbalanced concrete patio. The business uses durable and affordable concrete leveling polyurethane foam that supersedes traditional methods, such as mud jacking, when it comes to performance and providing a stable substrate for garage floors.

Foundational problems, age, and water damage often cause garage floors to sink and have an uneven surface. Acme Concrete delivers an innovative two-part process to address these garage floor challenges. It first fills the settling areas with a specialized grout material, then resurface the garage floor to look as good as new.

Erosion resistance is a crucial factor in determining the longevity of a concrete repair, as per Acme Concrete Raising & Repair. Its polyurethane foam has been engineered to be completely resistant to erosion. Concrete sinking is often caused by erosion. The high-density poly foam used by this business is environmentally friendly and solidifies within minutes after injection, maintaining its shape over time and without shrinking.

On the other hand, mudjacking grout, a combination of sand, clay or limestone, is highly susceptible to erosion and could be washed away by water and moisture over time. As a result, polyurethane foam has a clear advantage over mudjacking in terms of durability.

Acme Concrete's poly foam lifting system is more efficient and much cleaner. The equipment comes self-contained in a small box truck or pick-up and a small trailer, so there is no need for heavy construction equipment.

The polyurethane material comes ready to use on-demand, unlike the mudjacking process, which requires extensive and invasive equipment. Additionally, the polyurethane method is much quicker than mudjacking. In just 15 minutes after injection, a car can drive over the repaired concrete.
