

Rugged 4G Security Cameras Keep Communities Safe Across The Nation

October 05, 2023

Denver, Colorado - October 05, 2023 - PRESSADVANTAGE -

Fort Morgan, CO based AnywhereCam is pleased to make its suite of all-purpose cameras available to customers across the US and beyond. These cameras boast a range of features that would prove useful to homeowners and businesses alike, and the company is currently taking orders through the official AnywhereCam website.

No Power, No Wifi, No Problem

AnywhereCam bills itself as the ultimate provider of cameras for security purposes, and there are many reasons why the company is so confident in taking this position. For one, the cameras are not dependent on wires or battery longevity for power, and they can operate as easily via a cell phone signal as they can on Wi-Fi.

The company also understands that customers prefer not to have to hire other contractors or security

consultants to install devices that may already require a sizable investment to obtain. AnywhereCam's solution is to set up the customer's cameras prior to shipping so that they are primed to work right out of the box. This means customers can expect their cameras to be ready to meet their personal needs as soon as they arrive.

Since there is virtually no setup required (besides the relatively simple matter of choosing where to place the cameras), customers can begin using them with minimal hassle. There is no complicated app or program to navigate, and the customer can test the camera immediately provided it has power. The AnywhereCam team will also be happy to help the customer if required, providing free step-by-step video tutorials, suggestions on placement for maximum coverage and more.

AnywhereCam offers models that can function as both outdoor and indoor cameras. Customers who have tried out other manufacturers may expect that this means they will have to deal with certain drawbacks, such as subpar battery life, Wi-Fi dependence, a vulnerability to water damage and so on, but AnywhereCam is proud to confirm that their cameras do not suffer from such issues.

The company explains that their security cameras come ready to go with every necessary feature or utility included. Customers who purchase from AnywhereCam will find they now own all-weather cameras with built-in data service as well as cloud-based recording capabilities. Further, the inclusion of solar cells means these cameras can function for extended periods without having to be connected to a dedicated power line (or taken down for recharging). Certain models may last up to 14 days without Wi-Fi or power.

Residents in harsh climates will find their security camera investment rewarded with robust functionality, given the cameras are capable of operating between -20° F to 140° F. This relatively hands-free approach may lead some to be concerned that their cameras are more vulnerable to hackers and similar threats, so the company offers cameras that work with a SIM card. This has the added bonus of virtually eliminating the need to pay for additional cybersecurity.

These features (and others) make AnywhereCam the most versatile security camera platform on the market, with cameras for every situation, scenario and location. The company has paired this versatility with a corresponding degree of accessibility ? customers will find that their cameras (and captured footage) are incredibly easy to navigate thanks to the dedicated companion app. Once a camera is shipped, a user will be able to get connected and explore its myriad options with a few taps or clicks. Users should be aware that, in addition to monitoring their footage or feeds themselves, they will be able to share videos quickly whenever they wish. This may be particularly useful in emergencies.

No Power, No Wifi, No Problem

Cameras can be set up to record in response to a number of triggers, including light, sound and motion, making them excellent for locations that see little to no traffic or are otherwise inconvenient to check manually. Each setting can be adjusted to the customer's preference in the app.

The company invites the community to contact its US-based customer service team to follow up on any further inquiries or ask for advice setting up their brand new AnywhereCam security cameras in the best locations. Orders can be placed via the official AnywhereCam website, and the team can be reached via phone or email. The AnywhereCam app is available on both iPhone and Android.
