

New Wordpress Security Software WP Site Guardian Bonus Released

December 21, 2015

December 21, 2015 - PRESSADVANTAGE -

Security software experts Chris Hitman and Michael Thomas know hacker habits inside and out, and they have recently released a new product to protect WordPress sites from becoming hacker victims. WP Site Guardian was developed in response to an overwhelming need to protect such sites from intrusions because there are no effective security measures in place to prevent the installation of malicious plugins or themes. Their new software, however, is designed with how hackers operate in mind and can reportedly stop them in their tracks before any harm is done.

Hitman and Thomas recognized not just how simple it is to hack a WordPress site through the download of freely available coding but also what a large impact it has on victims utilizing the WordPress platform. It's not the intrusion itself that has the largest effect but the aftermath of a hacker's attack. Once a WordPress site has been compromised, it can be banned from Google results and puts a hacked site's users at risk for having sensitive information stolen as well. None of this bodes well for business, and WordPress takes no

responsibility for such unauthorized entries.

WordPress users frequently install plugins and themes to enhance the online experience for their customers, but these extras are actually the source of the problem. WordPress security expert and software developer Chris Hitman notes, "The problem is that most WordPress plugins and themes are not written by security experts and hackers know that. WP Site Guardian is a new generation security plugin that monitors the way visitors use your site and detects & blocks exploit execution attempts."

Hitman and Thomas take pride in the thoroughness of the WP Site Guardian software's ability to quickly detect potential security breaches and shut them down before any harm is done. This can save \$1000s in the average costs to fix the damage caused by hackers and restoring the WordPress site's reputability with search engines and even its web host. WP Site Guardian takes a broader security approach than similar products and purportedly yields far greater results because it not only shuts down the attack but blocks the source of the attack from accessing that site again. This software can even work on sites that already harbor malicious plugins or themes for greater effectiveness.

About WP Site Guardian

This security software company was developed by online security experts Chris Hitman and Michael Thomas to protect WordPress websites from malicious intrusions. It utilizes a fresh approach to security that is based on monitoring user habits and automatically detecting suspicious activity, so it can be blocked.
