

Sweetwater Systems of Phoenix Now Truly Green

January 11, 2016

January 11, 2016 - PRESSADVANTAGE -

Sweetwater Systems of Phoenix, AZ is pleased to report that each part of its products, services and operations have been completely designed with the assurance that they are ecologically-based. The company specializes in commercial water treatment, including provision of clean drinking water for office water service, RO systems and water softeners in the Phoenix area.

Some of the benefits of soft water include better taste, lower cost and a more ecologically responsible footprint. Because the water is filtered fresh as it is used, it doesn't adopt the plastic taste than can arise when the water sits for weeks in a plastic bottle. Although it is expected that bottled water doesn't contain harmful organisms, there is no assurance that the water in the bottle cooler is safe and healthy. There is a significant expense which is associated with the transport and storage of bottles, which is entirely eliminated by filtering the water at the delivery point.

As an ecologically responsible business, SweetWater Systems does not use petroleum products to make the bottles, and no carbon-based fuel is used to transport bottles back and forth.

Water safety in Arizona is an issue thanks to the toxins, mineral content and dissolved solids in the water. Normal water filtration does not take care of some of these elements. For this type of water content issue, it is suggested that a multi-stage reverse osmosis system is approved as a useful way to obtain purified fresh water at an affordable price. SweetWater Systems offers three different types of reverse osmosis purification process.

The filtration system provided by Sweet Water Systems never runs out of fresh, filtered water, since is tied into the house or office water system. The result is tested and certified water. The risk of lifting heavy jugs, clutter from water jugs, and the impact of plastic bottles in landfills are all reduced.
