

RESET Learning Revolutionizes Tutoring for ADHD Students with Cutting-Edge Neuroscience Strategies

October 01, 2024

October 01, 2024 -
RESET Learning has announced new initiatives to boost the effectiveness of tutoring for students with ADHD. By integrating findings from neuroscience and adopting new learning strategies, the company aims to improve focus, memory retention, and overall academic success for these students.

RESET Learning has a history of advancing educational methods. Their learning philosophies emphasize personalized instruction, active involvement from students, and evidence-based techniques. These approaches help students engage deeply with the material and retain information better.

A representative from RESET Learning said, "Recent research highlights how crucial it is to understand working memory, especially for students with ADHD. By aligning our tutoring practices with these scientific insights, we can offer more targeted support. Our goal is to help every student reach their full potential and succeed academically."

A key part of RESET Learning's strategy is using structured routines and setting clear goals. Tutors are encouraged to set objectives before each session and follow a structured plan. This helps students know what to expect and keeps them focused. The company's tutoring methods follow the "I do, we do, you do" approach, which promotes gradual learning and independence.

RESET Learning also draws on findings from a study by Mikael Lundqvist, Ph.D., at the Karolinska Institute. The study, featured on the Brain & Behavior Research Foundation's website, explores how working memory can retain, manipulate, and delete items. This research suggests that the brain uses "network space" to manage items in working memory without needing complex computations. Understanding this has important implications for teaching, especially for students with ADHD.

RESET Learning's new tutoring program uses these insights to help students use their working memory more efficiently. By focusing on the "network space" for items, tutors can help students manage and use information better. This aligns with the tutoring guidelines from the Gelfand Center at Carnegie Mellon University. These guidelines emphasize communication, transparency, goal-setting, and consistent routines, which are also key parts of RESET Learning's methods.

The representative added, "Our work with researchers and educational institutions ensures our tutoring strategies are based on the latest science. We are dedicated to giving our students the best possible learning experiences, tailored to their needs."

RESET Learning ensures tutors encourage students to take charge of their learning. Tutors ask thought-provoking questions, set priorities, and recognize students' hard work. This approach not only improves academic performance but also boosts students' confidence and motivation.

RESET Learning's tactics match broader trends in education. There's a growing focus on personalized learning and data-informed teaching practices. The company's initiatives are well-positioned to meet modern educational demands. Students with ADHD, in particular, benefit from these methods as they offer tailored support for their unique challenges.

For insights into the neuroscience behind working memory, see the research summary by the Brain & Behavior Research Foundation: https://bbrfoundation.org/content/research-suggests-how-working-memory-retains-manipulates-and-deletes-specific-items.

RESET Learning remains committed to helping students achieve their academic goals through innovative and effective tutoring methods. By staying up-to-date with educational research and using these findings in their practices, the company continues to offer valuable support to students with ADHD and other learning

challenges.
