

Stage 2 Networks Announces Launch Of Unified Communications App: HALO

January 28, 2016

January 28, 2016 - PRESSADVANTAGE -

Stage 2 Networks, a leading provider of Cloud Communications and VoIP services headquartered in New York, is proud to announce the launch of HALO, their unified communications application. Designed to help companies improve both their internal and external communication, HALO service is already being positively received.

Stage 2 Networks VP of Sales and Marketing Jimmy Riordan says: "HALO is designed to offer a number of benefits to clients. Essentially, it increases productivity for the whole team, enables employees to access critical data from anywhere and allows businesses to scale the system as they need, getting a greater return as they grow. All these benefits connect together to create what we call the 'HALO effect'."

HALO is supported across a multitude of devices (computers, smartphones, and tablets) and with features like Instant Messaging, Presence Management, file sharing, desktop sharing, and video, HALO enables businesses to stay connected anywhere, anytime, using any device. As more and more businesses are embracing the benefits of remote working, the HALO app fulfills that need by allowing employees to conduct business from any location. Unified communications for business is believed to be the way forward in

communication.

The beauty of our Cloud Voice and UC solutions is that we don't force a client to choose between a physical handset or a softphone. Businesses have employees that have different levels of technology proficiency, so some will want that Polycom phone on their desk, some will prefer just the HALO app on their laptop, and others will want both. It's our job to recognize that and customize the right communications solution for each and every one of our clients. That's what has set Stage 2 Networks apart and contributed to our success over the past 10 years.

Since 2005, the mission of Stage 2 Networks has been to provide superior voice solutions and mission critical business communications in leading US and global markets. They specialize in Cloud Voice, SIP Trunking, Unified Communications, internet connectivity and MPLS. Using a suite of custom, on-demand voice and data services, Stage 2's dedicated team of experts design a solution that fits their client's specific requirements.

To learn more about the Stage 2 HALO App or any their cloud voice and data services, businesses are encouraged to get a free demonstration by contacting 1-800-Stage2-0.
