Thompson Plumbing: Ensuring Homeowners? Safety by Addressing Sediment Buildup in Water Heaters

February 19, 2025

CARTERSVILLE, GA - February 19, 2025 -
Cartersville, GA ? Thompson Plumbing, a locally owned and operated business in Cartersville, Georgia, is committed to delivering reliable residential and commercial plumbing services. With over 25 years of experience, the company focuses on helping homeowners maintain safe and efficient plumbing systems. One of the most critical issues affecting water heaters is sediment buildup, which can cause serious problems if left unaddressed.

Sediment accumulation occurs when minerals like calcium and magnesium separate from heated water and settle at the bottom of the tank. This buildup forces the heater to work harder, leading to higher energy consumption and increased utility bills. Over time, it can take up space in the tank, reducing the amount of hot water available for household use. If ignored, sediment buildup can cause overheating, leading to damage within the tank and increasing the risk of leaks or failure.

Brandon Thompson, owner of Thompson Plumbing, emphasizes the importance of regular water heater maintenance. He states, ?Regular maintenance of your water heater is crucial. Ignoring sediment buildup can lead to inefficient heating, higher energy bills, and even premature failure of the unit.?

Thompson Plumbing is dedicated to educating homeowners about the risks associated with sediment buildup and the importance of preventive maintenance. By offering professional services in Cartersville and surrounding communities, the company helps residents maintain safe and functional water heating systems.

In its commitment to homeowner education, Thompson Plumbing recently published an informative blog post, ?Is Sediment in Hot Water Heater Dangerous? Find Out Here.? The article explains how sediment buildup affects water heaters and highlights common warning signs. Homeowners should pay attention to strange noises, such as popping or rumbling, which can indicate that sediment is interfering with the heating element. Discolored water, particularly a rusty or brownish tint, suggests sediment is affecting water quality.

Fluctuating water temperatures often mean that sediment is disrupting the heating process, making it difficult to maintain consistent hot water.

The blog post underscores the importance of regular maintenance, including annual tank flushing to remove sediment and checking the anode rod to prevent corrosion. Taking these preventive steps can extend the life of a water heater, improve energy efficiency, and ensure a steady supply of hot water.

Thompson Plumbing proudly serves Cartersville and surrounding areas, including Bartow County, Cherokee County, Paulding County, and Cobb County. The company provides plumbing services in Acworth, Kennesaw, Marietta, Cartersville, and Roswell. Their team of licensed and experienced plumbers remains dedicated to delivering high-quality service and customer satisfaction.

Customer reviews highlight the company?s dedication to quality work and responsiveness. One satisfied homeowner shared their experience, stating that Brandon Thompson personally went out of his way to locate a part to repair their water heater. They expressed appreciation for his excellent communication and quick response, noting that he scheduled the repair immediately. They highly recommended Thompson Plumbing for anyone needing fast, efficient, and professional plumbing service.

Homeowners looking for expert plumbing services can contact Thompson Plumbing by phone at 770-256-1324. The company?s office is located at 377 Old Mill Rd Suite D, Cartersville, GA 30120. Additional information about services and scheduling is available on the company?s website.
