Modern Vision Solutions Highlights Advanced Dry Eye Treatments in Exclusive Interview with Dr. Meagan Anderson

May 27, 2025

OMAHA, NE - May 27, 2025 -

Millions of Americans suffer from dry eye disease, an often-overlooked condition that can significantly impact daily life. In a recent interview on KMTV Omaha Extra!, Dr. Meagan Anderson, a leading optometrist at Modern Vision Solutions, shed light on the growing prevalence of dry eye, its symptoms, and the cutting-edge treatments now available to provide lasting relief. The discussion, hosted by Kary Wurth, revealed that while estimates suggest dry eye affects approximately 20% of adults, the true number is likely closer to 40%, underscoring the urgency for greater awareness and better treatment options.

Dry eye disease is commonly associated with discomfort, burning, itching, and irritation, but Dr. Anderson emphasized that symptoms can go beyond dryness alone. Many patients experience blurry vision and other subtle indicators that may not immediately point to dry eye, making early diagnosis critical. Surprisingly, the condition is no longer limited to aging adults. With increasing screen time in today?s digital world, children are also presenting with dry eye symptoms at an alarming rate. Reduced blinking while using screens appears to play a major role, further reinforcing the need for proactive eye care and innovative treatment solutions.

While artificial tears and warm compresses remain the first-line treatment recommended by many eye doctors, Modern Vision Solutions is advancing care with next-generation therapies designed to address the underlying causes of dry eye. Dr. Anderson discussed three state-of-the-art treatments available at the practice: LipiFlow, Blephex, and Intense Pulsed Light (IPL) therapy. LipiFlow is a breakthrough treatment that delivers gentle heat and massage to the eyelids, helping to restore function to the meibomian glands, which play a key role in maintaining a healthy tear film. This approach targets one of the most common causes of dry eye?meibomian gland dysfunction?by improving the quality of the eye?s natural oils and preventing rapid tear evaporation.

Another highly effective option, Blephex, utilizes a spinning brush to remove debris and bacteria from the eyelids, reducing inflammation and promoting better eye health. Dr. Anderson explained that this method is particularly beneficial for patients with blepharitis, a condition often linked to chronic dry eye. By thoroughly cleaning the eyelid margins, Blephex can significantly reduce symptoms that artificial tears alone cannot address.

For patients experiencing persistent inflammation, IPL therapy offers another advanced treatment option. Originally developed for dermatological applications, IPL has been found to be remarkably effective in treating dry eye by reducing inflammation on the eyelids and improving overall tear production. Dr. Anderson highlighted how this non-invasive treatment has transformed care for many patients who previously struggled to find relief. Unlike traditional treatments that provide only temporary comfort, these innovative solutions focus on the root causes of dry eye, offering long-term improvement in both symptoms and eye health.

Dry eye disease is not just an inconvenience?it can interfere with work, screen use, and daily tasks, reducing overall quality of life. For those who have struggled with persistent irritation or vision fluctuations, these cutting-edge treatments present a real opportunity to regain comfort and clarity. Modern Vision Solutions in Omaha is committed to staying at the forefront of dry eye care, ensuring that patients have access to the most effective solutions available today.

Reporters seeking expert insights into dry eye treatment advancements are encouraged to reach out to Modern Vision Solutions for additional commentary. With the increasing prevalence of dry eye across all age groups, this condition represents a significant public health concern that demands greater attention.
