SafeAir's Indoor Air Quality Podcast Highlights Health Dangers of Moldy Carpet and Importance of Early Testing

June 06, 2025

June 06, 2025 -

SafeAir Certified Mold Inspection Inc. has released a new episode of the Indoor Air Quality Podcast, focusing on the hidden health risks connected to moldy carpet. This episode includes expert insights from founder and lead inspector David Ansley, who shares key information about how indoor mold impacts health, especially when it grows undetected in carpet. The podcast episode supports a recent video launch that explains how carpets can become a source of mold growth and why early detection is important for personal health and safety.

The episode provides direct answers to questions homeowners often have. It explains how moisture becomes trapped in carpet and padding, allowing mold spores to grow and spread. It also addresses how mold in carpet may not be visible on the surface, which can lead to delayed action. David Ansley uses plain language to help listeners understand why this matters and how mold exposure can lead to symptoms like coughing, headaches, sinus problems, skin irritation, and fatigue. These signs are often dismissed or misdiagnosed, especially in homes with children, seniors, or people with asthma or other respiratory problems.

SafeAir?s approach begins with education. The episode opens with a clear explanation of what mold is and how it spreads. Listeners learn that carpet is often one of the first places mold will settle after a flood, leak, or ongoing humidity. The padding underneath is difficult to dry and can hold moisture for long periods. If the conditions are right, mold will grow in as little as 24 to 48 hours. Once it starts, it will continue to release spores into the air, which can be inhaled daily without any smell or sign of damage.

The podcast episode is part of SafeAir?s larger effort to inform the public about air quality and its effect on long-term health. The company has served the Atlanta area for years and has built its reputation on clear communication and honest testing. This podcast reinforces that mission by offering facts without technical language. It encourages people to take symptoms seriously and to test their indoor spaces if they notice any warning signs. Jeremy Shelton states clearly that you do not need to see mold to know you have a problem. In many cases, the air test is the first step to discovering an unseen source.

Throughout the episode, SafeAir promotes prevention and early testing. Instead of waiting for mold to become visible or for smells to become strong, listeners are urged to act at the first sign of moisture or discomfort. The podcast also reviews the steps involved in mold testing. These include an on-site inspection, air and surface sample collection, and a full report with lab results. This process allows people to understand exactly what type of mold is present and how widespread it is.

The podcast also discusses steps that can reduce the risk of mold growth. These include keeping humidity levels below 50 percent, drying wet areas quickly, and using professional-grade testing equipment when needed. SafeAir stresses that store-bought mold tests are not reliable and cannot provide the same level of detail or accuracy as professional tools. David Ansley advises that accurate information is the foundation of a safe and healthy indoor space.

This release comes at a time when many people spend more time indoors, and awareness of indoor air quality is growing. SafeAir hopes this podcast episode will help families, property owners, and renters understand how mold can grow without being seen and how it can affect daily health. The episode closes by inviting listeners to contact SafeAir for more information or to schedule an inspection.

SafeAir Certified Mold Inspection Inc. is known for its honest assessments and science-based methods. The company does not offer mold removal, which helps ensure its inspections are unbiased and focused only on clear results. This separation between testing and remediation has become a key part of the company?s identity and has helped build trust across the Atlanta area.

The Indoor Air Quality Podcast can be found on the SafeAir website and major audio platforms. The video version, titled ?Can Moldy Carpet Make You Sick??, is also available on the company?s site and social

media pages. Both formats work together to give users clear, useful information in a way that is easy to understand. The company encourages anyone with concerns about their indoor air to watch the video, listen to the podcast, and reach out with questions.

As mold concerns continue to rise, SafeAir remains committed to providing accurate testing and honest answers. This new podcast episode is the latest step in that effort, giving the public a new resource for learning how to spot and solve indoor mold problems before they grow into something larger.
