

## **Efficient Car and Pro Fleet Vehicle Repair Launch Integrated Fleet Maintenance Program for Commercial Operators**

*July 11, 2025*

WORTHINGTON, OH - July 11, 2025 - PRESSADVANTAGE -

Fleet operators across the country are achieving significant cost reductions thanks to the launch of Efficient Car's new data-driven scheduling platform, which is helping businesses cut maintenance expenses by up to 25%. Designed to streamline service intervals, reduce unplanned downtime, and optimize resource allocation, the platform represents a major step forward in intelligent fleet management.

Efficient Car, a leading innovator in fleet maintenance technology, developed the platform in response to growing demand from commercial vehicle operators for smarter, more reliable ways to manage their service needs. Leveraging real-time vehicle diagnostics, historical service data, and route analytics, the system automatically generates optimized maintenance schedules tailored to each fleet's operational usage.

According to Jason Bradshaw, Business Development Manager at Efficient Car, the platform was designed with one key goal in mind: to increase vehicle uptime and reduce preventable repair costs. Fleet managers

today face mounting pressure to maintain high service levels while minimizing operational expenses," said Bradshaw. "Our scheduling platform gives them a proactive solution—one that helps them stay ahead of mechanical failures, reduce the frequency of emergency repairs, and ultimately save thousands on long-term fleet costs."

The platform's machine-learning algorithm continuously analyzes telematics and sensor data to recommend maintenance actions before performance issues escalate into critical problems. As a result, fleet managers can avoid expensive unscheduled breakdowns, extend vehicle lifespan, and allocate service appointments based on both need and convenience.

In early pilot programs, fleet operators using the Efficient Car system reported a 25% reduction in overall maintenance costs over a six-month period. Beyond cost savings, users also experienced fewer vehicle out-of-service hours and increased customer satisfaction thanks to more consistent delivery and transport schedules.

One of the most notable aspects of the new system is its integration with service provider networks. Through a new partnership with Pro Fleet Vehicle Repair, the platform now enables seamless service booking with vetted mobile technicians and workshops across the country. This network ensures that fleet managers can schedule appointments directly through the platform and receive real-time updates on job status, parts availability, and technician arrival times.

"Pro Fleet Vehicle Repair brings decades of hands-on experience and a strong reputation for reliability to the table," Bradshaw noted. "By integrating with their national repair infrastructure, we're giving our customers faster access to qualified technicians and streamlining the entire maintenance process from start to finish."

The Efficient Car platform also includes advanced reporting tools that allow fleet managers to monitor trends, identify recurring issues, and measure cost-per-vehicle over time. This level of insight helps businesses make more informed decisions about vehicle rotation, retirement planning, and capital investment. For growing fleets, it provides a scalable solution that adapts to increasing complexity without adding administrative burden.

Jason Bradshaw emphasized that the system is particularly beneficial for small- to mid-sized fleets, who often lack the resources of larger logistics companies. "Many independent fleet operators are still working off spreadsheets and basic calendar tools," he explained. "Our technology automates that entire workflow. It doesn't just tell you when to get your vehicle serviced—it tells you why, where, and how to do it more efficiently."

The feedback from early adopters has been overwhelmingly positive. One logistics company operating a

60-vehicle delivery fleet reported that maintenance planning time was reduced by over 40%, freeing up staff to focus on operations and customer service. Others noted that improved preventative maintenance scheduling reduced tire and brake replacements, which had historically driven up quarterly repair budgets.

Efficient Car's rollout of this scheduling platform comes at a critical time for the industry. With supply chain disruptions still reverberating across transportation sectors and inflation increasing the cost of parts and labor, fleet operators are under greater pressure than ever to control overhead and avoid avoidable costs.

By embedding predictive analytics and AI into everyday fleet management practices, Efficient Car is not only helping businesses survive today's challenges—it's helping them prepare for tomorrow's. And with the partnership of Pro Fleet Vehicle Repair enhancing nationwide coverage and technical responsiveness, the company is positioned to support fleets of all sizes with intelligent, reliable service coordination.

In addition to its current capabilities, Efficient Car plans to release further enhancements to the platform later this year, including integration with fuel usage analytics, driver behavior metrics, and carbon emissions reporting. These tools aim to provide a holistic approach to fleet efficiency and sustainability, aligning with broader ESG goals.
