

## New Resource on TMS Therapy for Anxiety Published by Moment of Clarity

October 22, 2025

SANTA ANA, CA - October 22, 2025 - PRESSADVANTAGE -

Moment of Clarity has released a new resource titled "Transcranial Magnetic Stimulation for Anxiety", now available on their website. The article explores how transcranial magnetic stimulation (TMS) may support patients living with anxiety disorders, especially those who have not experienced lasting relief from traditional therapies. By presenting clear explanations of how TMS works and how it can be integrated into comprehensive treatment plans, the publication provides valuable information for patients and families considering advanced care.

Anxiety is one of the most common mental health concerns in the United States, often occurring alongside depression, trauma, and personality disorders. While psychotherapy and medication remain the first-line treatments, many patients continue to experience symptoms that interfere with daily life. The article explains that TMS, a noninvasive procedure using magnetic pulses to stimulate brain regions associated with mood and emotional regulation, may provide an alternative for people with treatment-resistant anxiety.

Research into TMS and anxiety is ongoing, but early results are encouraging. A 2019 study in the Journal of Affective Disorders found that repetitive TMS significantly reduced anxiety symptoms in patients with generalized anxiety disorder. The National Institute of Mental Health (NIMH) has also reported that TMS, while FDA-approved for major depressive disorder and obsessive-compulsive disorder, shows promise as an off-label treatment for anxiety. By highlighting both the evidence base and the ongoing need for further research, the resource provides a balanced view of what patients can expect.

The article emphasizes that TMS is not a stand-alone cure. Instead, it is most effective when combined with therapies such as dialectical behavior therapy (DBT), trauma-focused counseling, and group support. This integrated approach helps patients address both the biological and psychological aspects of anxiety, improving the chances of long-term recovery.

Moment of Clarity?s publication also discusses accessibility. For patients balancing work and family responsibilities in Santa Ana and the surrounding areas, flexible treatment models are essential. Teletherapy is highlighted as a valuable complement to in-person sessions, allowing patients to maintain continuity of care while integrating TMS into their overall treatment plan. Outpatient programs, such as intensive outpatient programs (IOP) and partial hospitalization programs (PHP), can also incorporate TMS, providing patients with access to advanced care without requiring inpatient admission.

Safety is another central focus of the resource. TMS is described as noninvasive, generally well-tolerated, and delivered in structured outpatient environments. The U.S. Food and Drug Administration (FDA) has approved TMS for depression, citing its strong safety profile. Common side effects are limited to mild scalp discomfort or temporary headaches, which typically resolve within a short period. This information reassures patients and families who may be hesitant about trying newer therapies.

The publication also acknowledges the stigma that continues to surround advanced psychiatric treatments. Many people delay seeking help because they worry about being judged or misunderstood. By presenting TMS as a medically supervised, research-supported therapy, the article helps normalize its use as part of modern mental health care.

Another key theme is the importance of addressing co-occurring disorders. Anxiety often overlaps with substance use, depression, or trauma-related conditions. The article notes that programs combining TMS with outpatient psychiatric care, family therapy, and holistic support provide the most comprehensive pathway to recovery. Patients are encouraged to view TMS not as a replacement for existing treatments but as an essential tool within a broader continuum of care.

By publishing Transcranial Magnetic Stimulation for Anxiety, Moment of Clarity reinforces its mission to educate communities about innovative approaches to mental health treatment. The resource provides

patients and their families with knowledge that empowers them to consider TMS as an option alongside

established therapies and to make more informed decisions about their care.

For individuals in Santa Ana searching for accurate information about advanced treatment for anxiety, this

resource offers practical, evidence-based guidance. By highlighting both the potential benefits and the current

research limitations, Moment of Clarity underscores its commitment to transparency, patient education, and

compassionate care.
