

## **Chapman Heating and Cooling Expands HVAC Services to Meet Regional Demand**

*November 03, 2025*

LOUISVILLE, KY - November 03, 2025 -

Chapman Heating and Cooling has expanded its operational coverage to include HVAC services in the Jeffersontown area. The decision was made following a review of service requests and infrastructure data across Jefferson County, where consistent demand for heating, ventilation, and air conditioning support was identified.

The evaluation revealed an upward trend in calls for HVAC maintenance, repair, and installation across both residential and commercial properties. Jeffersontown, a community combining long-established neighborhoods with growing commercial development, showed a mix of service needs tied to aging systems, updated equipment, and diverse building structures.

"Jeffersontown demonstrated consistent service demand during our review," said Matt Vaughn Jr., spokesperson for Chapman Heating and Cooling. "The expansion of HVAC services into this area reflects those findings."

As part of the rollout, technician coverage has been allocated specifically to Jeffersontown, dispatch routes

have been adjusted, and service vehicles have been stocked with components and tools most frequently used in HVAC repairs. These operational steps were developed based on the most common repair scenarios recorded in the company's internal data.

Service reports from the area highlighted recurring issues including uneven heating, reduced air conditioning output, and ventilation concerns in older homes. Many of these properties contained systems that had been in operation for decades, resulting in a higher likelihood of performance decline. In newer subdivisions, service requests tended to involve calibration checks, thermostat adjustments, and maintenance inspections for recently installed units.

Commercial properties contributed additional complexity to the service profile. Offices, schools, and retail spaces in Jeffersontown were found to rely on large-scale, multi-zone HVAC systems. These systems require specialized planning, longer service appointments, and targeted technician preparation compared to residential work.

Chapman Heating and Cooling has indicated that the effectiveness of the expansion will be monitored through several internal performance metrics, including appointment availability, service completion rates, and average response times. These indicators will be evaluated periodically to determine whether additional operational changes are necessary as the new coverage takes shape.

Vaughn noted that the decision to introduce HVAC services in Jeffersontown is part of a larger initiative to review and update operations throughout the Louisville metropolitan area. "Every community we serve has its own service conditions and infrastructure," he said. "Jeffersontown stood out as a location where system age, population growth, and service frequency aligned with the need for expanded coverage."

The community's range of housing and commercial developments played a major role in the assessment. Established neighborhoods often generated requests for heating and cooling system repairs, while newer residential areas produced calls related to system tuning and preventive maintenance. Together, these conditions created a varied service landscape that shaped the decision to expand.

Seasonal climate fluctuations in Kentucky also contributed to the findings. The region's cold winters and humid summers create year-round demand for HVAC services. Data from Jeffersontown showed balanced service requests across both heating and cooling seasons, indicating the need for continuous coverage rather than seasonal scheduling adjustments.

The expansion of HVAC services in Jeffersontown aligns with Chapman Heating and Cooling's ongoing effort to adapt operations based on documented service demand. Similar evaluations are underway in other nearby communities, where decisions will be guided by call volume, technician utilization, and the age

distribution of local systems.

By analyzing service data and infrastructure patterns, Chapman Heating and Cooling continues to refine how it allocates resources throughout Jefferson County. The addition of HVAC services in Jeffersontown represents one step in a broader process of adjusting operations to meet localized needs while maintaining consistent service planning across the region.
