

## **St. Catharines Naturopath Explains the Differences Between Bioidentical and Conventional Hormone Therapy**

*October 15, 2025*

St Catharines, ON - October 15, 2025 - PRESSADVANTAGE -

As women in St. Catharines navigate the transitions of perimenopause and menopause, many seek clarity on the options available for hormone replacement therapy (HRT). To provide educational insight into this important topic, Dr. Aoife Earls, ND, a licensed naturopathic doctor based in St. Catharines, has published a new blog post titled "Bioidentical Hormone Therapy and Conventional HRT: Differences Explained by A St. Catharines Naturopath."

The article explores how both conventional hormone replacement therapy and bioidentical hormone therapy aim to restore balance in declining hormone levels while differing in formulation, regulation, and individual suitability. It provides a clear overview of how women may consider each option in consultation with qualified health professionals.

According to the post, conventional hormone therapy often uses standardized formulations such as

conjugated estrogens or synthetic progestins. These medications have been studied extensively and are known for their consistency and regulated dosing. Many patients may prefer conventional HRT for its well-documented research base and predictability in formulation.

In contrast, bioidentical hormone therapy (BHT) employs compounds designed to be structurally identical to the body's own hormones. These may be available either as Health Canada-approved medications or as customized compounded preparations from specialized pharmacies. The blog explains that bioidentical options appeal to those interested in hormones that closely resemble natural physiology, and naturopathic doctors may discuss these options as part of an integrative care plan.

However, the post emphasizes that "bioidentical" does not mean "risk-free." Approved bioidentical hormones, such as transdermal estradiol or micronized progesterone, are closely regulated, while compounded versions may differ in their consistency and quality control. The article reinforces that individualized assessment and monitoring are essential for safety, regardless of hormone source.

The blog also addresses several common myths about bioidentical hormones, noting that misconceptions often arise about safety, superiority, or "naturalness." It underscores that even naturally derived hormones require professional supervision and should be considered within the broader context of each person's health history.

Beyond comparing formulations, Dr. Earls's blog highlights the importance of integrative support. Many naturopathic consultations incorporate holistic strategies such as nutrition, herbal medicine, and stress management techniques that may complement either conventional or bioidentical hormone use. Nutrient-dense diets rich in phytoestrogens, calcium, and magnesium, alongside practices such as mindfulness or gentle movement, are described as part of a broader lifestyle foundation for navigating menopause more comfortably.

The blog also emphasizes the role of individualized care when determining hormone strategies. Each woman's experience of perimenopause and menopause is unique, shaped by health history, lifestyle, and personal preferences. As part of a naturopathic consultation, discussions may explore both conventional and bioidentical options, helping patients understand how these approaches align with their goals and values.

This educational resource underscores that there is no one-size-fits-all solution to hormone therapy. Informed decisions come from understanding the distinctions between therapies, considering risks and benefits in context, and integrating care under professional guidance. The post encourages women to work closely with healthcare providers to identify balanced, personalized solutions that support their long-term wellbeing.

This integrative perspective reflects Dr. Earls's ongoing commitment to public education on topics central to

women's health and menopause transition. Women interested in learning more may read the full article on Dr. Aoife Earls's official website.

This latest resource builds upon earlier community education efforts by Dr. Earls, ND. A recent press release from the Naturopath St Catharines clinic explored naturopathic perspectives on stress management and emotional resilience. Together, these educational releases demonstrate an ongoing effort to bridge the gap between conventional medicine and individualized, holistic strategies for everyday health concerns.

Dr. Earls, ND continues to welcome new and returning patients seeking to understand their hormone health in a supportive and evidence-informed environment. Her clinic in St. Catharines also offers virtual consultations for residents throughout Ontario, ensuring accessible options for those looking to explore integrative healthcare from the comfort of home.
