

Examining the Connection Between Menopause, Hormones, and Sleep

October 25, 2025

October 25, 2025 - PRESSADVANTAGE -

Sleep disturbances are among the most common and yet least discussed experiences for women entering their 40s and beyond. To shed light on this issue, Dr. Aoife Earls, ND, a licensed naturopathic doctor based in St. Catharines, has published a new blog post titled "Menopause and Sleep After 40: Insights from a St. Catharines Naturopathic Doctor."

The article explores how hormonal fluctuations that occur during perimenopause and menopause may significantly affect sleep patterns. Many women begin noticing changes such as difficulty falling asleep, frequent waking, or night sweats long before their periods stop entirely. These symptoms are described in the blog as common indicators of shifting hormone levels that may influence both nightly rest and daytime energy.

According to the post, addressing sleep concerns in the context of hormonal change requires looking beyond surface-level exhaustion. Naturopathic consultations often include a discussion of estrogen, progesterone,

cortisol, and melatonin—the four hormones most linked to sleep quality and rhythm. Each of these plays a role in maintaining deep, restorative rest, and the blog article describes how their natural fluctuations with age may lead to disrupted sleep cycles.

The piece emphasizes that while some sleep changes may be expected with age, persistent insomnia or fatigue signals a need to explore the underlying physiology. Naturopathic evaluation may consider how hormonal balance, stress management, nutrition, and lifestyle patterns contribute to restlessness. By understanding each of these elements, a more comprehensive picture of women's midlife sleep health may emerge.

Women in St. Catharines seeking to understand these patterns will find that the blog presents menopause not as a decline but as a transition—one that benefits from informed, individualized support. The discussion includes practical examples of how lifestyle approaches may complement hormonal support. Evening relaxation routines, balanced nutrition, and mindful reduction of stimulants such as caffeine and alcohol are presented as foundational steps for supporting natural sleep rhythms.

The blog also introduces several naturopathic strategies that may be discussed during care, including nutritional guidance, herbal medicine, and stress management practices. Herbs like black cohosh or red clover are mentioned in relation to hot flashes, while valerian and passionflower are explained as potential tools in sleep support discussions. Additionally, mindfulness, gentle exercise, and breathing practices may help regulate cortisol levels, the body's primary stress hormone, which influences both sleep and energy.

For women exploring different forms of hormone support, the article acknowledges that both conventional hormone replacement therapy (HRT) and bioidentical hormone therapy (BHT) may be part of individualized treatment discussions. In the naturopathic context, collaboration with prescribing physicians is emphasized to ensure that any hormone therapy aligns with safety protocols and evidence-informed care.

Dr. Earls, ND notes in her post that when these conversations happen within a framework of self-awareness and professional guidance, they provide an opportunity for women to feel more balanced and informed. The goal of the article is to help readers understand how natural changes in hormones affect sleep—and how addressing those changes holistically may contribute to a sense of stability during midlife transitions.

For many readers, the new blog post continues an ongoing educational series from Dr. Aoife Earls, ND. It follows a previous press release from the Naturopathic St. Catharines doctor, which compared bioidentical and conventional hormone therapies for menopause. That earlier article outlined the distinctions between standardized formulations and bioidentical compounds, emphasizing the importance of understanding each approach's context, formulation, and professional oversight. Together, these educational releases demonstrate Dr. Earls's commitment to helping St. Catharines residents engage with reliable, balanced

information on hormone health and natural care.

The new resource expands on this foundation by exploring how hormonal changes influence sleep patterns?one of the most immediate concerns for women navigating perimenopause and menopause. Rather than focusing solely on hormonal therapy options, the article takes a broader view, highlighting how daily lifestyle factors, nutrition, and environmental settings may influence rest quality.

Dr. Earls, ND also notes that many women underestimate the ripple effects of poor sleep. The blog discusses how ongoing sleep disruption may affect mood, metabolism, and concentration, reinforcing why comprehensive evaluation is important. From a naturopathic standpoint, integrating personalized testing and functional analysis may help identify unique physiological patterns contributing to sleeplessness.

By combining an educational tone with practical insight, the post encourages women to seek supportive care that respects both the science of hormone changes and the individuality of each patient?s experience. It highlights that insomnia after 40 does not always have to be accepted as inevitable but may be explored as part of a larger health conversation.

Residents in St. Catharines interested in understanding their hormone health, energy, or sleep patterns are invited to learn more about Dr. Aoife Earls ND?s work. Her clinic continues to welcome new and returning patients in-person and offers virtual services across Ontario.
