K L Contractor Plumbing Inc Ask The Plumber Series Why Water Heaters Make Noise and What Homeowners Should Do About It

October 23, 2025

MARIETTA, GA - October 23, 2025 -

K L Contractor Plumbing Inc has published a new blog that explains a common household issue many homeowners face: unusual noises coming from their water heaters. The article, titled ?Why Is My Water Heater Making Noise? Causes and Fixes With K L Plumbing?, provides clear explanations of the possible causes, what the sounds may indicate, and when professional service is needed. The goal of this latest publication is to help homeowners understand that water heater noises should not be ignored, as they can signal underlying issues that may worsen over time.

The blog details the most frequent reasons a water heater may start making rumbling, popping, or banging sounds. These noises often point to sediment buildup, pressure changes, or faulty components inside the unit. By breaking down these causes in simple terms, the article makes it easy for readers to recognize which problems may be minor and which may require immediate attention.

Marketing Director Alex Laldin said the new post was created in response to frequent customer inquiries about noisy water heaters. ?Many people hear strange sounds coming from their water heater and aren?t sure what they mean,? said Laldin. ?Some think it?s just a normal part of aging equipment, while others worry that the system is about to fail. Our goal with this blog is to give homeowners practical information they can use to understand the issue and decide the right next step.?

The blog explains that sediment buildup is one of the leading causes of noise in water heaters. Minerals in the water, especially in areas with hard water, settle at the bottom of the tank over time. When the heating element operates, the trapped sediment causes water to boil underneath it, leading to popping or rumbling sounds. The article stresses that flushing the tank regularly can prevent sediment from accumulating and extend the system?s lifespan.

Laldin emphasized that proper maintenance can prevent most noise-related issues before they start. ?Flushing your water heater once or twice a year is one of the simplest and most effective ways to keep it quiet and efficient,? he said. ?Ignoring those noises doesn?t just create an annoyance. It can shorten the life of your system and increase your energy costs. A noisy water heater is usually telling you something?it?s always best to listen.?

The blog also describes other possible causes of noise, including loose fittings, expanding metal parts, and fluctuating pressure levels. It warns that knocking or hammering sounds could point to water hammer, a pressure surge caused by sudden valve closures. The company advises that this issue should always be addressed by a professional plumber to prevent pipe damage or system leaks.

Laldin noted that homeowners often underestimate the importance of addressing small issues early. ?A lot of people think they can live with the noise, but that noise can be the first sign of a larger problem,? he said. ?We?ve seen cases where what started as a minor rumbling turned into a major leak a few months later. The earlier you call a plumber to inspect it, the easier and more affordable the fix will be.?

The article includes guidance on distinguishing between normal operational sounds and noises that indicate trouble. A mild humming sound may occur naturally in electric water heaters due to vibrations from the heating element, while popping, screeching, or banging noises should prompt an inspection. The blog emphasizes that professional diagnosis ensures the problem is fixed safely without causing further damage to the system.

K L Contractor Plumbing Inc encourages readers to consider professional service for older water heaters that show signs of inefficiency or recurring noise problems. The company?s technicians specialize in diagnosing the source of the issue, whether it involves sediment buildup, valve malfunction, or component wear. By addressing these problems early, homeowners can avoid costly repairs and maintain consistent access to hot

water.

Laldin explained that the company?s blogs are part of a broader effort to help customers understand their plumbing systems and prevent avoidable damage. ?We believe in giving our customers the knowledge to make smart decisions,? he said. ?The more they understand about how their systems work, the better they can maintain them. Our latest article reflects that approach by focusing on a simple but important issue that affects almost every household at some point.?

The blog also reassures readers that most noise issues can be resolved without full system replacement. Regular maintenance, inspection, and cleaning can often restore quiet operation and improve efficiency. The company emphasizes that professional plumbers can perform these tasks safely and identify other potential concerns during the process.

K L Contractor Plumbing Inc has built a reputation for combining practical advice with professional expertise. The company?s educational content is written in plain language, making it accessible to all homeowners regardless of technical experience. Laldin said that this commitment to clarity is part of what sets the company apart. ?We know plumbing can be confusing,? he said. ?That?s why we focus on straightforward explanations. Our goal is to make sure every homeowner who reads our blog walks away with real understanding, not just a list of problems.?

Homeowners interested in learning more about water heater maintenance or troubleshooting can read the full blog post, ?Why Is My Water Heater Making Noise??, on the company?s website. The article provides practical steps that homeowners can take to maintain safe and efficient operation of their water heaters year-round.

K L Contractor Plumbing Inc is a professional plumbing company providing reliable residential and commercial services across the region.
