

Wound Care Delaware Launches Mobile Wound Care Service

October 27, 2025

NEWARK, DE - October 27, 2025 -
Wound Care Delaware today announced the launch of a mobile wound care service effective October 27, 2025, expanding access to clinical wound assessment and treatment across Delaware. The program operates from the organization?s medical clinic at 1101 Twin C Lane, Suite 201A, Newark, DE 19713, and is designed to bring licensed clinicians to patient residences and care facilities in coordination with referring providers.

?The new service enables the clinical team to deliver wound evaluation and procedures in residential and facility settings while maintaining continuity with the clinic,? said Dr. John Ashby, physician at Wound Care Delaware. ?The model emphasizes coordination with primary care, specialty practices, and case managers to support timely scheduling and documentation within established care plans.?

Wound Care Delaware operates a brick-and-mortar medical clinic that serves as the logistical base for mobile deployment. The clinic schedules visits, verifies coverage, and coordinates referrals. The mobile teams travel to patient residences, skilled nursing facilities, and assisted living facilities under physician oversight. The program incorporates documentation that aligns with referring provider instructions and plan of care

requirements.

The mobile service follows a standard visit structure that includes intake, assessment, and procedure documentation. Clinicians record wound characteristics, materials used, and follow-up intervals in the patient record. The team communicates with referring offices regarding visit outcomes and next steps. This structure supports continuity across settings and reduces duplicate appointments. The objective is consistent record keeping within existing treatment plans.

The organization states that the service footprint includes communities throughout Delaware. The clinic address remains 1101 Twin C Lane, Suite 201A, Newark, DE 19713. The main line is (302) 404-2541. The scheduling team assigns routes based on geographic clusters and provider availability. The mobile units operate on weekdays with the capacity to adjust hours for facility coordination. The service integrates with transportation and building access policies at each location to meet compliance and safety requirements.

The clinical scope includes assessment of acute and chronic wounds as defined by referring providers. The team performs wound measurements, dressing changes, and related procedures that fall within licensure and policy. The program supports transitions of care following hospital discharge when wound care tasks are ordered for the home setting. Records from mobile visits are retained with clinic records to maintain a single chart. This approach enables a consolidated history for case review.

Wound Care Delaware maintains procedures that address consent, privacy, and infection control. Staff utilize protective equipment according to policy. Instruments and materials are handled in accordance with manufacturer instructions. Documentation is completed in an electronic record that supports secure data retention. The organization conducts periodic reviews of visit notes for completeness and consistency. Staff education covers route planning, equipment management, and incident reporting.

The program?s operational design centers on coordination with existing care teams. Referring clinicians transmit orders to the clinic, and the scheduling team assigns a visit window. The mobile team confirms entry instructions with the residence or facility. After the visit, the team transmits notes to the referring office. This process aligns tasks among providers and reduces administrative delays. The model is intended to keep the plan of care intact across settings.

Wound Care Delaware began developing the mobile capability to address logistical barriers that can arise for patients with limited mobility or transportation. The clinic serves as a point of contact for questions about

routes, referrals, and documentation. The organization notes that the mobile service will adapt as referral patterns evolve. The clinical team will evaluate routing, equipment, and staffing on a recurring basis to match demand. The goal is reliable scheduling and consistent documentation.
