

## **Local Rehab Exposes Hidden Signs of Trauma in New Port Richey**

*November 06, 2025*

NEW PORT RICHEY, FL - November 06, 2025 - PRESSADVANTAGE -

Clean Recovery Centers has released a new blog that breaks down what a trauma response is and how it continues to affect both the body and mind long after a traumatic event ends. Many people don't realize that reactions such as feeling on alert, shutting down, or over-accommodating others can stem directly from trauma rather than personality or preference.

The blog explains that trauma responses are the body's way of reacting to a perceived threat. As the post states, "Trauma responses are a reaction to a perceived threat. This doesn't happen to just anyone - it specifically happens to those who have experienced a traumatic event." While trauma can impact anyone at any age, those exposed to traumatic events early in life are more likely to experience long-lasting effects. The blog cites research noting that "68.41% reported experiencing 1 or more ACEs and 23.03% reported experiencing 4 or more ACEs" among Florida adolescents.

Clean Recovery Centers emphasizes how trauma can come from many different types of harm, including violence, neglect, betrayal, bullying, or combat exposure. Regardless of the source, trauma shifts the stress response and leads to one of four main reactions: fight, flight, freeze, or fawn.

These trauma responses can look different from person to person. Some may become reactive and loud. Others may appear quiet and withdrawn. A trauma response can vary in intensity, meaning some individuals may experience more subtle reactions while others exhibit a louder or more noticeable response, the blog explains.

Trauma doesn't just affect emotions; the body remembers what happened. The blog highlights that many survivors experience physical symptoms with no clear medical cause. These are not imagined they are very real reactions to the nervous system's ongoing distress. Chronic pain, headaches, stomach issues, and fatigue are common. Over time, the stress can impact immune function and even increase the risk of cardiovascular disease.

The brain also changes in response to trauma, especially when the trauma occurs during development. The post notes that trauma can lead to increased fear responses, emotional reactivity, poor stress responses, trouble concentrating, and difficulties with memory or impulse control. Some individuals may feel shut down, while others may feel overwhelmed by their reactions; both are valid symptoms of a nervous system trained to protect against danger.

The blog also clarifies the difference between trauma responses and trauma symptoms. A trauma response is the immediate or conditioned reaction to perceived danger, such as aggression, withdrawing from a situation, freezing in place, or trying to appease the threat. Symptoms, however, are the long-term expressions of unresolved trauma, including nightmares, flashbacks, dissociation, and emotional dysregulation.

Even though trauma can root itself deeply, healing is possible. Though trauma is deep-rooted, the brain and nervous system are capable of healing, the blog says. Therapeutic approaches such as rapid resolution therapy (RRT), eye movement desensitization and reprocessing (EMDR), cognitive behavioral therapy (CBT), and narrative therapy can help individuals process what happened and reduce the power of traumatic memories.

The post also recommends coping tools that support recovery between therapy sessions. These include movement, grounding exercises, breathing techniques, and creative outlets. Having coping skills at the ready will help calm both trauma responses and trauma symptoms, the blog explains. Because recovery isn't linear and every person's journey looks different, the blog reminds readers that progress comes from combining therapy, consistency, and self-compassion.

Living with the effects of trauma can make the world feel unsafe and unpredictable, the post states. But with the right care, people can build trust, regain emotional stability, and reconnect with their own sense of

security. Trauma therapy helps individuals ?regain a sense of safety and control? and begin rebuilding a life that feels steady and hopeful.

Clean Recovery Centers provides trauma-informed care across all levels of treatment in New Port Richey and throughout the Tampa Bay region. Each location includes a certified rapid resolution therapist, ensuring survivors have access to specialized support as they heal.
