VeriSpine Joint Centers Advances Regenerative Medicine as Alternative to Surgery for Chronic Pain

November 12, 2025

Stockbridge, GA - November 12, 2025 -
VeriSpine Joint Centers, a leading pain management practice in Georgia, is highlighting the transformative potential of regenerative medicine therapies as effective alternatives to surgical intervention for patients suffering from chronic joint and spine conditions. The medical center reports significant success rates using platelet-rich plasma (PRP) therapy and stem cell treatments for conditions traditionally requiring surgery.

The center's regenerative medicine program addresses degenerative disc disease, disc herniations, and osteoarthritis through biological treatments that harness the body's natural healing mechanisms. These advanced therapies represent a fundamental shift in pain management, moving beyond symptom control to actual tissue repair and regeneration at the cellular level.

"Regenerative medicine is revolutionizing how we approach chronic pain conditions that previously left patients with surgery as their only option," said Fitzclarence Harper, Jr. MD, Medical Director at VeriSpine Joint Centers. "Our PRP and stem cell therapies are showing remarkable results in patients with degenerative disc disease and osteoarthritis, often eliminating the need for invasive procedures while providing lasting pain relief through regenerative medicine."

Platelet-rich plasma therapy involves extracting a small sample of the patient's blood, processing it to concentrate healing platelets, and injecting this concentrated solution directly into damaged tissue. The growth factors in PRP stimulate tissue repair and reduce inflammation. Stem cell therapy takes this approach further by using the patient's own stem cells, typically harvested from bone marrow or adipose tissue, to regenerate damaged cartilage, tendons, and other structures.

The financial implications of choosing regenerative treatments over traditional surgery are substantial. While surgical procedures for conditions like herniated discs can range from $20,000 to $50,000 with recovery times extending several months, regenerative medicine treatments typically cost a fraction of that amount with minimal downtime. Patients often return to normal activities within days rather than the weeks or months required after surgery.

Clinical outcomes at VeriSpine Joint Centers demonstrate the effectiveness of these treatments. The center reports that many patients with moderate to severe osteoarthritis experience significant pain reduction and improved joint function following regenerative therapy. Similarly, patients with degenerative disc disease who were previously considering spinal fusion or disc replacement surgery have found relief through these biological treatments.

"The science behind regenerative medicine continues to evolve, and we're seeing applications expand beyond what we thought possible just a few years ago," noted Dr. Harper. "For patients who want to avoid surgery or aren't surgical candidates due to other health conditions, these treatments offer real hope for recovery and improved quality of life."

The latest VeriSpine Joint Centers news reflects a broader trend in pain management toward less invasive, more biologically-based interventions. As insurance providers increasingly recognize the cost-effectiveness and clinical benefits of regenerative medicine, access to these treatments continues to expand.

VeriSpine Joint Centers operates multiple locations throughout Georgia, providing comprehensive pain management services including interventional procedures, physical therapy, and regenerative medicine treatments. The practice specializes in treating personal injury, workers' compensation cases, and chronic pain conditions affecting the spine and joints.
