

Sarkinen Industrial Pipelining Expands Trenchless Mainline Repairs Throughout Pacific Northwest

December 04, 2025

VANCOUVER, WA - December 04, 2025 -
Sarkinen Industrial Pipelining has expanded its trenchless pipeline rehabilitation services across Washington and Oregon, addressing growing infrastructure demands with advanced no-dig solutions that minimize disruption to communities and businesses.

"Infrastructure rehabilitation has become critical for communities throughout the Pacific Northwest as many pipeline systems reach the end of their service life," said a spokesperson for Sarkinen Industrial Pipelining. "Our CIPP Sewer Lining technology allows municipalities and property owners to restore their pipeline systems without the extensive costs and disruptions associated with traditional excavation methods."

The company's expansion comes as municipalities and property owners increasingly seek cost-effective alternatives to traditional excavation methods for aging sewer and stormwater systems. Sarkinen Industrial Pipelining now offers comprehensive pipeline services ranging from 3-inch to 36-inch diameter pipes, utilizing state-of-the-art technology including robotic cutting systems and high-definition inspection equipment.

The expansion addresses increasing demand from various sectors, including municipal governments, ports, industrial facilities, commercial properties, and homeowners' associations. Recent infrastructure assessments across the region have identified significant rehabilitation needs, with many pipeline systems installed decades ago now requiring immediate attention to prevent failures and environmental impacts.

The company specializes in Cured In Place Pipelining, a trenchless rehabilitation method that creates a new pipe within the existing damaged infrastructure. This process eliminates the need for excavation, reducing project timelines from weeks to days while preserving landscaping, roadways, and surrounding structures. The technology uses either UV light or steam curing techniques to create a seamless, corrosion-resistant pipe that extends the infrastructure's lifespan by decades.

Beyond pipeline rehabilitation, Sarkinen Industrial Pipelining provides comprehensive diagnostic and maintenance services, including closed-circuit television inspections, vacuum truck services, and hydro jetting. The company's robotic pipeline cutting technology addresses complex blockages caused by concrete intrusion, root infiltration, or accumulated debris without requiring excavation.

Sarkinen Industrial Pipelining maintains certifications in advanced robotic systems, LightRay technologies for pipe inversion, and comprehensive safety protocols such as OSHA compliance and confined space operations. The company provides 24-hour emergency response services throughout Washington and Oregon, ensuring critical infrastructure issues receive immediate attention.

The company's technical capabilities include steam-cured pipe lining, UV spot repairs, and T-Liner installations for lateral connections. These technologies enable precise repairs at junction points where lateral pipes connect to mainlines, traditionally one of the most challenging aspects of pipeline rehabilitation.

Sarkinen Industrial Pipelining serves the Pacific Northwest region with a focus on minimizing environmental impact while maximizing infrastructure longevity. The company's trenchless methods significantly reduce carbon emissions compared to traditional excavation, eliminate the need for heavy equipment in sensitive areas, and preserve existing landscapes and hardscapes. Their comprehensive approach combines initial assessment through high-definition camera inspection, customized rehabilitation planning, and long-term maintenance programs designed to extend infrastructure lifespan while reducing overall costs for property owners and municipalities.
