

ABC Damage Restoration Announces Winter Prevention Guide for Ice Dam Water Damage

December 15, 2025

SPRINGFIELD, MO - December 15, 2025 - PRESSADVANTAGE -

ABC Damage Restoration has released comprehensive guidance to help property owners prevent costly winter damage from ice dams as temperatures drop across Missouri. The Springfield-based restoration company is sharing professional insights on identifying early warning signs and implementing preventive measures before ice dam formation leads to significant water damage.

Ice dams form when heat escaping through inadequately insulated attics melts snow on roofs, causing water to refreeze at colder eaves and create ridges that trap additional meltwater. This trapped water can seep under shingles and into homes, resulting in extensive damage to walls, ceilings, and structural components. ABC Environmental reports that ice dam water damage claims typically increase by 40 percent during Missouri winters, making prevention strategies essential for property owners.

"Ice dam prevention starts with understanding how heat loss from living spaces creates the perfect conditions for these damaging formations," said Johnathon Benton, a representative from ABC Damage Restoration.

"Property owners who take proactive steps now, including improving attic insulation and ventilation, can avoid thousands of dollars in restoration costs later this winter."

The company's prevention checklist emphasizes five critical areas that property owners should address before winter weather intensifies. These include improving attic insulation to R-38 or higher standards, increasing ventilation through soffit and ridge vents, sealing air leaks around electrical fixtures and plumbing penetrations, maintaining clean gutters for proper drainage, and removing excess snow accumulation after significant storms.

Early detection remains crucial for minimizing damage when ice dams do form. Warning signs include large icicles hanging from gutters, water stains appearing on interior ceilings or walls, and ice buildup along roof edges. Property owners noticing these indicators should document the conditions and consider a professional assessment before damage escalates.

The timing of this guidance coincides with National Weather Service predictions for below-average temperatures across Missouri through February. Historical data shows that properties experiencing ice dam damage often require extensive restoration work, including water extraction, structural drying, insulation replacement, and mold remediation if moisture problems persist.

"Prevention costs a fraction of what restoration requires after water has infiltrated a structure," added Benton.
"Simple maintenance tasks completed now can prevent emergency calls during freezing conditions when damage is already occurring."

ABC Environmental Contracting Services operates throughout Missouri, providing water damage restoration, mold remediation, and emergency response services. The company maintains certification through industry restoration organizations and employs technicians trained in the latest drying technologies and restoration techniques. Founded as a locally owned business, the company serves residential and commercial clients across Springfield, Columbia, St. Louis, and surrounding communities, offering round-the-clock emergency response for water damage incidents.
